A SOLVAY PRODUCT

NYTRON is a totally different type of synthetic organic detergent. Its high and rapid solubility makes NYTRON go into solution almost instantly, in hot or cold water. It remains chemically stable over a wide range of temperature, acidity or alkalinity.

NYTRON removes oil and grease from fabrics, surfaces and metal parts; and it counteracts hard water difficulties. In addition, NYTRON will foam in any normal concentration of acid or alkali, in distilled or sea water, in ice cold or boiling water. Try it—see why NYTRON'S *exclusive combination of properties cannot be matched by any other synthetic organic detergent!*

Samples of NYTRON—plus informative literature regarding its uses—are available on request. Get a sample . . . try it . . . convince yourself! Mail the coupon now.

BOOKS FOR INDUSTRY

Chemical Economics Handbook, directed by Raymond H. Ewell. Stanford Research Institute, Stanford Calif. Subscription $250 yr., additional copies to same organization, $60.

HERE IS an entirely new kind of chemical data service. It promises to fill what has been a long-felt need for a coordinated body of standardized information on production, sales, consumption, prices, exports and imports of individual chemicals and end-chemical groups. In addition to these, however, it includes related data on the major economic indicators, principal chemical-consuming industries, and raw materials. A section on regional data has been announced for inclusion next year.

The service is provided in the form of standardized 8½ x 11 sheets which fit a special ring binder supplied with subscription. Each sheet carries data on one subject, in unusually clear and easy-to-read chart form. Where trend lines are important, they have been included. All charts carry back to 1910, or as soon thereafter as the statistics are available.

Plan of the service is to issue about 400 data sheets a year, in groups of 20 to 40 a month. Mailings were started in September, and thus far have amounted to 93 sheets. Some 160 more are planned for the rest of 1950.

Subscriptions entered at any time during the year cover the data sheets for that year. Dr. Ewell anticipates that only new sheets will be issued during 1950 and 1951, but in subsequent years revised sheets will be issued along with additional new ones. During 1950 information will be presented on all chemicals produced in amounts over $5,000,000 a year and many in the $1,000,000 to $5,000,000 range. The smaller-value chemicals will be covered in subsequent years.

Introduction to Textile Chemistry, by Bruce E. Hartsuch. John Wiley and Sons, Inc., New York; 413 pp., $4.75.

THIS BOOK is designed for readers desiring a nodding acquaintance with the complex field of textile chemistry. A chapter on simple chemical calculations plus one on organic chemistry gives the layman a smattering of the chemistry that is encountered later in the text. The meat of the work, however, is in the sections dealing with the natural fibers and the more prominent synthetics. Synethtic polymers as Vinyon, Saran, Orlon and the ever present Nylon receive adequate coverage. Treatment of such related subjects as dyes and dyeing has intentionally been omitted in the belief that these fields are too specialized for inclusion in an introductory volume.

The simple approach augmented by much background and industrial information is intended to provide a foundation for those who will continue into the field. Primarily a student's text, the work by virtue of its general approach may be of benefit to textile specialists in fields outside their own.

The Technology and Chemistry of Alkaloids, by Frank E. Hamerslag. D. Van Nostrand Company, Inc. New York; 319 pp., $6.50.

A VOLUME devoted to the chemistry of alkaloids with the emphasis on manufacturing processes. Much historical detail has been sacrificed to present a maximum of practical chemical information. Treatment of the subject is subdivided according to the alkaloidal families, omitting such commercially insignificant groups as the morphine and cinchona alkaloids. A discussion of the general methods of production, including descriptions of equipment and machinery, is a novel feature intended to make the book attractive to those engaged in the manufacture of alkaloids and their derivatives.

Industrial Chemistry, by E. Raymond Riegel. Reinhold Publishing Corp., New York, 1015 pp., $7.00.

THE NEW fifth edition of this well-known text retains the organization and scope of the earlier editions. However, following recent developments, new material is presented on antibiotics, new organic insecticides and fungicides, new dyeing techniques, atomic energy and the many recent developments in petroleum and plastics.

Very complete revisions have been made of the chapters on glass, water and sewage, sugar and photography. In all chapters descriptions of current processes have been integrated with earlier material.

Laboratory Experiments in Organic Chemistry, by Roger Adams and J. R. Johnson. The Macmillan Company, New York; xiv + 525 pp., $3.25.

IN THE fourth edition of this popular laboratory manual, the sections on laboratory operations have been revised extensively so that greater emphasis is given to details of correct manipulation, and the exposition of underlying principles has been expanded.

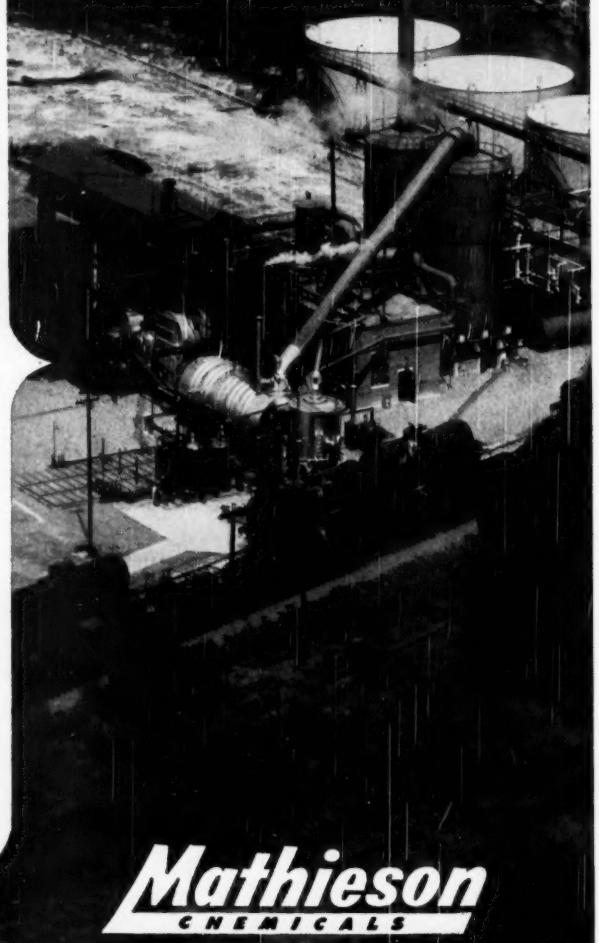
Several new experiments have been added to provide a wider selection and permit further variation from one year to another.

Biological Studies with Polonium, Radium, and Plutonium, edited by Robert M. Fink. McGraw-Hill Book Co., New York; vvi + 411 pp., $3.75.

THIS VOLUME reports the experimental studies carried out by the Biological Chemistry Section of the Division of Radioactivity in the Manhattan Department of the University of Rochester. Part I deals with the distribution and excretion of polonium; Part II discusses the distribution and excretion of radium; and Part III deals with the comparative toxicities of polonium, plutonium, and radium. Based on Manhattan Project reports, the book includes a critical survey of literature concerning those elements and the section's own studies.

Principles of Ionic Organic Reactions, by Elliot R. Alexander. John Wiley & Sons, Inc., New York; viii + 318 pp., $5.50.

THE AUTHOR, who is assistant professor of chemistry at the University of Illinois, breaks down a great many diverse organic reactions into fundamental steps based on ionic mechanisms. The first six chapters of the book deal with the fundamental intermediates and types of reactions from which most ionic transformations can be constructed. The remaining chapters give a detailed coverage of individual processes such as Grignard reactions, Claisen condensations, etherification, esterification, aromatic substitution, etc.



Written from the organic chemist's point of view, the book is nonmathematical and non-physical in presentation.

Melting and Solidification of Fats, by Alton E. Bailey. Interscience Publishers, Inc., New York; xiv + 357 pp., $7.

THIS BOOK is one of a series of monographs on the chemistry and technology of fats, oils, and related substances. It is a correlation and interpretation of experimental data on the melting and solidification of fats and fatty acids revealing the interrelationship between the phenomena associated with phase transformation. The text has been written primarily for the practicing oil and fat chemist or technologist, although portions may be of interest to physical chemists at large. For the nonspecialist, a brief and somewhat elementary introduction to physical chemical principles, laboratory methods and techniques has been included.

3 Points that favor using MATHIESON SULPHURIC ACID

1 **UNIFORMLY HIGH PURITY**—Mathieson Sulphuric Acid is clear, colorless and free from such impurities as arsenic, selenium and tellurium because it is made exclusively from pure elemental sulphur in modern equipment.

2 **FULL SELECTION OF GRADES**—Mathieson Sulphuric Acid is available in all commercial grades, ranging from 60° Bé. to oleum, 20%.

3 **BULK SHIPMENTS**—Mathieson Sulphuric Acid is available in tank trucks, tank transports, tank cars and tank barges from Baltimore, Md.; and in tank cars from North Little Rock, Ark.; Shreveport, La.; Beaumont, Port Arthur and Pasadena, Tex.

Mathieson—with its great manufacturing facilities including two of the largest sulphuric acid units in the world—makes not only sulphuric acid but most of the other basic chemicals and many of their derivatives. Be sure to consult Mathieson in planning for your future supply of basic chemicals. Mathieson Chemical Corporation, Mathieson Building, Baltimore 3, Md.

Plasticizer OF THE MONTH

HARFLEX 500*

Appearance: Light Yellow Liquid

Specific Gravity: 0.931 @ 20/20° C.

Acidity: 0.1% max., calc. as Acetic Acid

Fire Point: 485° F.

Viscosity: 57 seconds, Saybolt at 100° F.

Weight: 7.76 lbs. per gallon

USES

HARFLEX 500 is highly recommended for use with vinyl chloride-type resins. It combines high efficiency and superior cold flex resistance with excellent processing characteristics, ageing qualities, heat resistance, and water resistance, in one plasticizer at low cost.

THE READER WRITES

A Missing "Plus"

To the Editor of Chemical Industries:

I appreciated your presentation of the Aliphatics Chemicals article in your August issue.

However, I must take your proofreaders to task for messing up the formula on the top of column 1, page 189. The third line of the formulas should be

$$R_1CH_2CH{=}CHCHO{+}H_2 \rightarrow .$$

E. H. RIDDLE
Rohm & Haas Co.
Philadelphia, Pa.

We regret sincerely that a vital plus sign eluded both printer and proofreader.—ED.

Mixed Bed Demineralization

To the Editor of Chemical Industries:

In your July, 1950, issue of CHEMICAL INDUSTRIES, page 24, in your interesting topical column, What's New, you have a description of mixed bed demineralization or deionization. There are several inaccuracies in this article which we believe deserve some correction on the part of the editors.

Mixed bed demineralization was first described in 1941 in British Patent 553,233 assigned to the Permutit Company, Ltd. This is in direct contrast to the statement that the "origin of this essentially simple idea is lost in dim antiquity." Portable mixed bed units of cation exchangers and anion exchangers were supplied by Permutit to the Armed Services during World War II for making demineralized water.

Separating procedures for mixed bed demineralization units were studied by several investigators. The first successful work along this line that we are familiar with, was by Dr. F. K. Daniel in 1946.

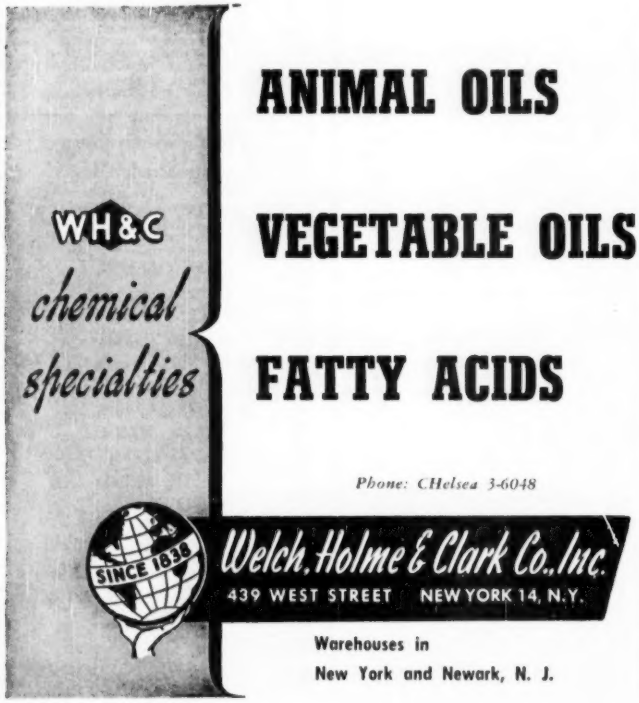
We believe that this information will be of interest to the readers of your magazine who may be confused by the large amount of promotional work that has been done in this field.

M. E. GILWOOD, Manager of
Chemical Research
The Permutit Co.
New York, N. Y.

CI is aware, of course, of Permutit's work in the field of mixed-bed demineralization. However, we regard the development described as being the first commercial application of the principle—leaving aside the rather special use in portable kits for the armed services.—ED.

More Petroleum Aromatics?

To the Editor of Chemical Industries:



In the Newsletter section of your July issue you comment that several (petroleum) refiners plan on installing such processes as platforming "to convert gasoline stocks to aromatics" and that "chemical users of aromatics will be the gainers when refiners offer them inevitable surpluses."

I fear you paint too rosy a picture. It is true that various platforming installations, for improving installations, for improving the octane rating of virgin naphtha, are under way and that the products may contain up to 50% aromatics, but this will mean little or nothing in the overall picture of aromatics supply. In the first place, naphtha fractions containing up to 50% aromatics are already available in tremendous volumes from the multitudinous cat crackers that the petroleum industry is already operating. Unfortunately, fractionation equipment and the installed capacity of the extractive distillation equipment necessary to get from this level up to the purity required by chemical users of benzene, toluene, etc., are limited and the cost of installing such equipment is high. The availability of a (comparatively) small additional amount of aromatic feed stock will not change the overall situation very much.

The unfortunate fact is that if the chemical users of aromatics want really large additional supplies from the petroleum industry they will have to pay for the installation of additional extractive distillation equipment or its equivalent, and this will take both considerable time and a lot of money. Operating costs will be substantial even for large installations and with gasoline octane ratings going higher and higher the base value of light aromatics to the refiner has increased sharply and is already crowding 20 cents a gallon. Final costs of petroleum aromatics of "chemical grade" are inevitably high. Furthermore, barring some unforeseeable new development, benzene from petroleum will apparently always cost more than toluene since its concentration in cracked naphthas, "hydroformates," "platformates," etc., is normally very much less than that of toluene, thus increasing extraction costs for benzene. The same is in general true as to benzene/toluene ratios in aromatic virgin naphthas.

WM. B. PLUMMER
Indoil Chemical Co.
Chicago, Ill.

CI's thanks to Reader Plummer for his thorough discussion. Hardly starry-eyed, CI was peering at the long-term outlook. Benzene users, for instance, are faced not so much with a cost problem as an absolute shortage.—ED.

Mutual's

SODIUM BICHROMATE

OTHER NAMES: Sodium Dichromate, Bichromate of Soda

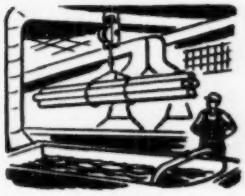
FORMULA: $Na_2Cr_2O_7.2H_2O$

MOLECULAR WEIGHT: 298.05

DESCRIPTION: Deliquescent, orange-red, prismatic crystals.

- Bulk Density averages 96 lb. per cu. ft.
- $Na_2Cr_2O_7.2H_2O$ 99.8% min.
- Chloride as Cl 0.06% max.
- Sulfate as SO_4 0.2% max.

USES: Chrome tanning of hides to produce durable, flexible leather. Yellow, orange and green pigment manufacture. Corrosion control in water and brine systems, drilling muds, petroleum pipe lines, etc. Surface treatment of metals to improve corrosion resistance, surface finish or paint adherence. Mordanting and oxidation of dyes for textiles. Photography, bleaching and purification of fats, chemical oxidation, wood preservation and others.



SHIPPING CONTAINERS: Bags—100 lb. net
Fibre Drums—400 lb. net

HEYDEN CHEMICALS

FOR Better PROTECTIVE COATINGS

PENTEK®

Pentaerythritol, Technical. For formulating architectural enamels, gloss paints, marine and automotive finishes. A raw material for plasticizers, emulsifying agents, waxes and other products. Shipped in 80 lb. multiwall paper bags.

DIPENTEK®

Dipentaerythritol, Technical. Consists of 90% dipentaerythritol and 10% related solid polyhydric alcohols. A raw material for resins, surface coatings and organic synthesis. Shipped in 175 lb. fiber drums.

FORMALDEHYDE

Clear, colorless solution free of impurities. Assays not less than 37% by weight. Available as Formaldehyde Solution U.S.P. or as Methanol-free Formaldehyde. Shipped in tank cars, tank trucks, drums, carboys and bottles.

PARAFORMALDEHYDE

High assay product of top uniformity and purity. A raw material for plastics, resins, adhesives, etc. Powder, Flo Granules and Granules. Shipped in 250, 100, 50 and 25 lb. fiber drums.

LIGNOCOL®

Antioxidant and anti-skinning agent for paints, varnishes, lacquers, inks, putties. Prevents skinning without increasing drying time. Shipped in 450 lb. stainless steel drums and 50 lb. boxed tin cans.

GUAIACOL Liquid, Technical

Highest quality antioxidant, anti-gumming and anti-skinning agent for solvents, paints, varnishes, etc. Shipped in 450 lb. drums and 50 lb. tins.

BENZOIC ACID, Technical

A white to yellowish white powder, melting at 121° to 122°C. Used in the manufacture of alkyd resins, for viscosity control, etc. Shipped in 100 lb. barrels.

M.D.A.® (Methylene Disalicylic Acid)

A technical grade of dihydroxy diphenylmethane dicarboxylic acid. Buff colored powder, soluble in methanol and acetone. Insoluble in water and petroleum hydrocarbon. Used to produce modified phenolics for varnishes, fast drying paints, inks, etc.

HOW TO GET

IMPROVED QUALITY AND LOWER VISCOSITY PLASTISOLS WITH BARRETT* "ELASTEX" 10-P PLASTICIZER

Key: Black—"ELASTEX" 10-P Plasticizer; Grey—di-2-ethylhexyl phthalate

In the manufacture of plastisols for coating and low-pressure molding operations, compounders have long known the value of di-2-ethylhexyl phthalate as a primary plasticizer. Dispersions of vinyl resins in this plasticizer possess good storage stability, and are of moderately low viscosity. The coatings and molded articles produced from them exhibit good physical and performance characteristics.

Now Barrett offers the plastisol compounder an even more efficient dispersant—"ELASTEX" 10-P Plasticizer.

Plastisols prepared with this high quality primary plasticizer possess lower viscosity and better storage stability than do those compounded with equivalent amounts of di-2-ethylhexyl phthalate. At the same time, the fused products exhibit improved physical properties, and are subject to less volatile loss.

If you manufacture plastisols for spread coating, molding, or casting, the superior performance of Barrett "ELASTEX" 10-P Plasticizer is well worth investigating.

✓ **NOTE:** Technical advice on the use of BARRETT Chemicals is available to you through the assistance of Barrett representatives. Why not put your problem up to us? Phone, wire or write.

SODIUM DISPERSIONS

.... **SEND FOR THIS NEW BULLETIN**

This 11-page Technical Bulletin describes the preparation, use and handling of Sodium Dispersions. Prepared by our Research Division, the bulletin suggests an entirely new field of Sodium chemistry. Sodium, in this finely-divided form, makes possible increased reaction rates, improved yields, lower reaction temperatures and decreased side reactions. For the latest information on how to use Sodium Dispersions, address your inquiry on company letterhead to: Sales Department, National Distillers Chemical Corporation, Ashtabula, Ohio.

NATIONAL DISTILLERS CHEMICAL CORPORATION

National Distillers
CHEMICAL CORPORATION

CONTRACT REMINDER...

for AERO* PHTHALIC ANHYDRIDE

Widely used in the manufacture of phthalic alkyd resins, phthalate esters, phthalocyanine pigments, and vat dyes.

- Free-flowing, clean, white flakes
- Exceptionally free from color and odor-forming impurities

for AERO* DOP

Di-2-Ethyl-hexyl Phthalate

This is the leading plasticizer in its field for vinyl resin films; an excellent plasticizer for nitrocellulose and synthetic rubber because of such features as:

- Low freezing point
- Low brittle point
- Low vapor pressure
- Light color
- Good compatibility

for AERO* FUMARIC ACID

Increasingly popular in the coating resins manufacturing field for improving color retention, chemical resistance, and drying speed. Also used in the production of plastics, laminating resins, and printing inks based on its reactions by condensation and addition polymerization.

- Free-flowing—easy to handle
- Non-hygroscopic

for MALEIC ANHYDRIDE

A highly reactive industrial chemical—with a double bond and two available acid groups—for use in the manufacture of alkyd-type resins, pharmaceuticals, rubber, and surface active agents.

For versatile intermediates in Chemical Synthesis, consider AERO FUMARIC ACID and MALEIC ANHYDRIDE.

"We recommend . . ."

Recommendations from Wyandotte Technical Service are not "off-the-cuff." Here's how we worked with one Caustic Soda customer.

We recommended that he use liquid caustic rather than solid. We helped him appraise his plant conditions. We drew up schematic diagrams outlining the handling of liquid caustic. We showed him how to dilute the liquid to the concentrations he needed. We drew up a cost estimate for the handling system. We recommended the types of equipment we felt he needed.

He turned our prints over to his engineers for execution. But we continued to advise him throughout the construction program. We inspected the finished system. And we were on hand when the switch was thrown for the first tank car shipment.

In one year's time, his savings paid for the installation . . . and began to return him a profit.

Service like this is not for the "favored few." It is available to any Wyandotte customer. Not just for Caustic Soda, but for Soda Ash or any Wyandotte product. Wyandotte Technical Service is not a sales gimmick. It is an outgrowth of our feeling that we should share with our customers the accumulated experience of 60 years of chemical making.

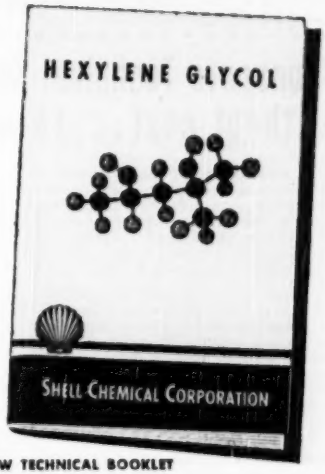
FROM SHELL CHEMICAL

HEXYLENE GLYCOL

(2-Methyl-2, 4-pentanediol)

A versatile, stable glycol with a variety of industrial applications



THE DIVERSIFIED USES of Hexylene Glycol are a result of *four* distinguishing features. Hexylene Glycol is (1) an ideal coupling or blending agent; (2) a high-boiling (198.3° C) solvent and penetrant; (3) an efficient wetting and dispersing agent; and (4) a mild humectant.

Hydraulic Brake Fluids. Brake fluids which contain Hexylene Glycol have high tolerance for moisture . . . show little tendency to promote rubber swelling . . . exhibit low corrosion characteristics . . . form clear solutions with other castor oil brake fluids.

Printing Inks. At ordinary temperatures press stability is insured by the low vapor pressure and mild hygroscopicity of Hexylene Glycol. At elevated temperatures of flash-dry ovens the relatively high volatility of Hexylene Glycol permits fast drying with higher, more uniform press speeds.

Cleaning Compounds. Hexylene Glycol, as a coupling agent in engine cleaners and general industrial cleaners, effects stable and homogeneous emulsions. In pre-spotting soaps, Hexylene Glycol couples the soap with water, contributes solvent power and facilitates the removal of last traces of soap and water during dry cleaning.

Other applications suggested by the coupling, wetting and high solvency properties of Hexylene Glycol include soluble cutting oils, grinding fluids, wood fungicides and textile assistants.

NEW TECHNICAL BOOKLET
Contains data on industrial applications . . . includes useful charts, tables, properties and specifications.

Booklet mailed on receipt of your letterhead request. Samples of Hexylene Glycol are available for your evaluation.

For Your Information

MONSANTO PLASTICS

Every month Monsanto publishes three pages of pertinent information. Here you will find suggestions and applications ideas selected to help you improve your products, lower your production costs, increase your profits. More information will gladly be furnished on request.

Here's the easiest way to solve your plasticizer problems

CALL ON MONSANTO . . . . FOR TECHNICAL SERVICE . . TO SOLVE YOUR PROBLEM

Monsanto Technical Service is available . . . without cost . . . to users of plasticizers

If a vinyl plasticizer problem rears up while you're developing a new product, improving your present line or seeking ways to cut costs or speed up processing, don't let the problem get you down. Call on Monsanto Technical Service and solve your difficulty as easy as **1 . . . 2 . . . 3.**

1. Monsanto's fully-equipped application laboratory will work for you without cost or obligation. Write, wire or phone and tell us your troubles. We will save you the initial work by recommending a *proved* formulation. Or, the Monsanto Technical Service Staff will work out a tailor-made formulation for you. If necessary, and if you desire it, a specialist will work with you *in your plant.*

2. Monsanto Santicizers are the world's most complete line. With this *complete* vinyl plasticizer line at their command, our technicians can recommend *exactly* the right plasticizer, or combination of plasticizers, *you* need.

3. Your problems are solved so you gain the advantages of improved products, lowered costs or more efficient processing. For further information on this *confidential* Monsanto service to users of plasticizers, mail the coupon or get in touch with the nearest Monsanto Sales Office.

FREE

Details on the world's most complete line of vinyl plasticizers, plus technical information of value to plastics manufacturers, are yours in the 80-page book, "Monsanto Plasticizers." Mail the coupon for your *free* copy.

NEW DATA on Monsanto's flavor and aroma chemicals

New solubility data on Monsanto's Ethavan,* vanillin and coumarin are available in three recently revised folders. Folders also contain information of interest to industries that use such chemicals for flavoring, as aromas or for masking undesirable odors and tastes. Mail the coupon for your *free* copies of these folders.

Inhibitor 038 stops corrosion, protects products and containers

Inhibitor 038 protects steel containers from corrosion when it is added to most nonaqueous solvents and solutions. It guards such products against picking up dissolved metal and permits shipment in metal instead of in glass or wood. For details write Monsanto, Everett Station, Boston 49, Massachusetts.

Carpet cleaner becomes germ killer by addition of Monsanto Santophen 1

The list of formulators who are incorporating Monsanto's Santophen* 1 in their floor and carpet cleaners is growing by leaps and bounds. There are several important reasons, in addition to its low cost, why there is an increasing preference for Santophen 1. Here are some of them:

Santophen 1 reduces bacteria count drastically. In one instance a rug cleaner containing Santophen 1 cut the bacteria count in carpet from 8,000,000 per square yard to 16 per square yard.

Santophen 1 is compatible with commonly-used soaps and synthetic detergents.

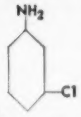
When properly formulated, Santophen 1 retains its bactericidal activity in commercial cleaners.

Santophen 1 controls mildew.

Santophen 1 is safe and convenient to handle, (a) formulated, (b) by itself.

Many formulations containing Santophen 1 have been registered with the U. S. Department of Agriculture.

If you want more information on the use of Santophen 1 in cleaning compounds or for any germicidal uses, mail the coupon.



Plasticizer storage data

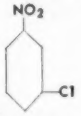
If you are interested in bulk tank storage of plasticizers, mail the coupon for a free copy of Monsanto Bulletin No. O-69.

TWO INTERMEDIATES WORTH INVESTIGATING

Here are two intermediates that already have usage in the manufacture of dyestuffs and pharmaceuticals. However, it is believed these products may have a much wider range of applications. Read the information given below. If you see possible use in your work, send for samples.

meta-CHLOROANILINE

Formula:  **Mol. Wt.: 127.57**



Properties:
Clear light-yellow liquid
Assay, 99% Min.
Crystallizing Point — minus 10.6° C. Min.
Distillation Range — 228° C. start, 231° C. dry point, 95% within 1.0° C.

Reactions:
Undergoes typical reactions of aromatic amines such as diazotization, acylation and alkylation. Reacts with CS_2 to give substituted thioureas and condenses with aldehydes.

Suggested Uses:
As an intermediate in the manufacture of azo dyes and pharmaceuticals.

meta-CHLORONITROBENZENE

(meta-Nitrochlorobenzene)

Formula:  **Mol. Wt.: 157.56**

Properties:
Greenish-yellow crystalline mass
Crystallizing Point — 43.9° C. Min.

Reactions:
Can be reduced to meta-chloroaniline and other intermediate products.
Can be further chlorinated, nitrated or sulfonated.

Suggested Uses:
As an intermediate in the preparation of dyestuffs and pharmaceuticals.

Looking for nontoxic plasticizer? Here are three with BAI's O.K.

If a nontoxic plasticizer will aid you in creating new products or improving ones now in your line, look into Monsanto Santicizer* 141, Santicizer B-16 and Santicizer E-15. All of these have been accepted as nontoxic by the Bureau of Animal Industry, U. S. Department of Agriculture.

Often, of course, you'll want to combine various other properties with nontoxicity in order to get the qualities you want in finished products. Monsanto, with the world's most complete line of plasticizers for polyvinyl chloride, can supply the right plasticizer to solve your problem.

AROCLOR 1248 . . . efficient, nonflammable liquid-phase heat-transfer medium

Monsanto's Aroclor* 1248 (chlorinated biphenyl) is a nonflammable liquid-phase heat-transfer medium for operations up to 300° C. (572° F.) that delivers both efficiency and safety. Aroclor 1248 has been used successfully for many years in industrial plants.

Aroclor 1248 has operated in gas-fired units ranging in capacity from 200,000 to 400,000 b.t.u. per hour. Commercial installations, with capacities up to 2,000,000 b.t.u. per hour and small electrically-heated stationary and portable units, with capacities around 40,000 b.t.u. per hour, have given excellent service with Aroclor 1248.

Nonflammable and noncombustible qualities of Aroclor 1248 have been established thoroughly by scientific tests. The spontaneous ignition temperature of Aroclor 1248 is 704° C. or 1299° F. This is well above practical requirements for operating units at 300° C. In spray tests, it was found that Aroclor 1248 required 64% oxygen for combustion. Fluids requiring over 45 to 50% oxygen in the spray test failed to cause fire in incendiary tests.

Monsanto, maker of Aroclor 1248, does not manufacture heating units, but will gladly refer you to concerns which produce such units. For details, mail the coupon for Technical Bulletin No. P-130, or contact the nearest Monsanto Sales Office.

Santomerse No. 1, efficient, all-purpose detergent-wetter

To name each specific use for Monsanto Santomerse* No. 1, the all-purpose detergent and wetting agent, would take considerable time and space. Broadly speaking, Santomerse No. 1 is worth investigating in any operation requiring a detergent, wetter, penetrant, emulsifier or dispersant.

Santomerse No. 1 is an alkyl aryl sulfonate compound with a minimum of 40 per cent active ingredient. It is an efficient detergent, which makes abundant suds in hard or soft, hot or cold water. It is effective in acid or alkaline solutions.

For further information on Santomerse No. 1, mail the coupon.

FOR YOUR LIBRARY

Timely Monsanto publications, listed below, will be sent free to users of chemicals. Use the convenient coupon to indicate the items you want.

* * *

Bulletin No. O-63—Laboratory and field studies of para-dichlorobenzene as a volatile fungistat.

* * *

Technical Bulletin No. O-D-601—Flame-resistant hydraulic fluid, OS-16.

commercially pure fatty acids...

(concentration of 90% or above)

Today, you don't have to buy a mixture of fatty acids to get the one you really want. Now, you can select a pure Neo-Fat fatty acid, tailor made to fit your exact needs. Armour's new chemical plant utilizes the Armour-developed *fractional distillation process* to separate crude fatty acids into their component acids, with a degree of purity never before possible (concentrations of 90% or above). This means you can now select the specific fatty acid you desire—without taking an equal or greater percentage of other acids which may contribute nothing to your formulation.

If you are interested in a fatty acid tailored to meet your requirements, send us your specifications for prompt quotation on price and delivery.

Take the guess work out of your fatty acid buying . . . always specify Armour Neo-Fats. They're economical because they're tailor made for your use.

tops in hydrophilic colloids—

HERCULES®

CMC

CELLULOSE GUM

TYPICAL APPLICATIONS

Cellulose gum (CMC, sodium carboxymethylcellulose) is unsurpassed among water-soluble colloids for its combination of suspending, thickening, stabilizing, and film-forming properties. In Hercules purified cellulose gum (food, cosmetics, and pharmaceutical grades) you are assured of a product which is consistently uniform and meets in every way the standards of such authorities as The Toilet Goods Association, Inc.

Containing 99.5+% sodium carboxymethylcellulose, dry weight basis, Hercules cellulose gum is suitable wherever a hydrophilic colloid is required, including pharmaceutical preparations designed for human consumption.

Send for technical data and testing sample.

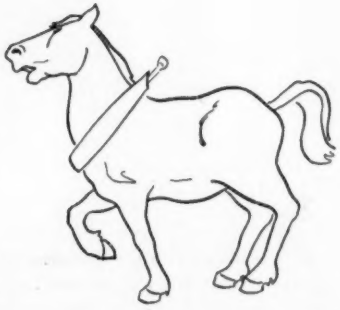
CM50-4

Onyx BTC*...

Cationic Germicide and Deodorant

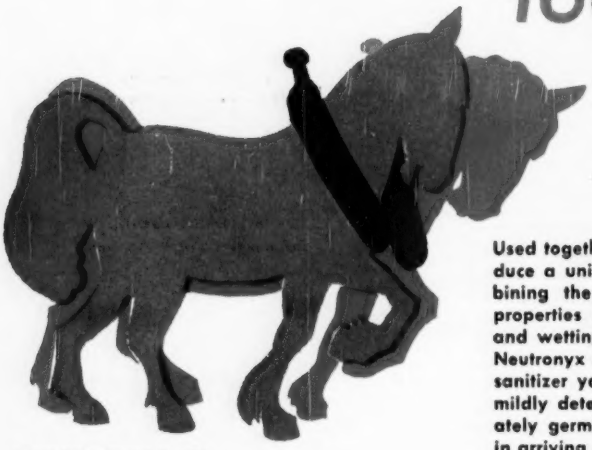


By Itself ... is the most dependable quaternary for sanitization purposes.

- the original cationic germicide, thoroughly tested and documented.
- no toxicity or skin irritation to worry about.
- no concern about shelf life.
- a 50% aqueous solution of alkyl dimethyl benzyl ammonium chloride ... stable, uniform, dependable.

You'll never go wrong when you specify BTC* for your sanitizing and deodorizing formulations. For the complete story, write for the BTC* booklet.

Neutronyx 600...



Non-Ionic Detergent and Wetting Agent

By Itself ... one of the most effective and dependable detergents, wetting and emulsifying agents now available.

- Compatible with acids, alkalies, electrolytes, hard water and cationic and anionic surface-active agents.
- Usable at elevated temperatures because of its low volatility.
- Chemically stable. Will not deteriorate in storage.
- An aromatic polyglycol ether with a host of potential uses in the formulation of industrial and household cleaners, and for economical wetting and emulsifying action wherever required.

You won't go wrong when you specify Neutronyx 600. Write for the 600 booklet.

TOGETHER...

Detergent Sanitizers to meet your special requirements!

Used together, Onyx BTC* and Neutronyx 600 produce a unique series of detergent sanitizers, combining the superior germicidal and deodorizing properties of BTC* with the effective detergency and wetting, emulsifying and dispersing action of Neutronyx 600. You can get any type of detergent sanitizer you want, from the strongly bactericidal, mildly detergent, to the heavily detergent, moderately germicidal. We are ready to work with you in arriving at the combination which will best meet your needs.

Davison Silica Gel

FINELY-SIZED SYNTHETIC SILICA

—for products or processes requiring non-crystalline silica of high purity—

—as small as .5 micron diameter average!

Davison has the experience and knowledge to chemically control silica gel production for precise uniformity of structure. Such silica gel characteristics as pore size, density and internal surface area are altered to assure maximum benefits in your application.

If you need a finely-sized, non-crystalline synthetic silica of high purity, write for information, specifications and samples of Davison silica gel. We will be happy to give you our recommendations based on experience and research. Mention your proposed application when writing.

Properties

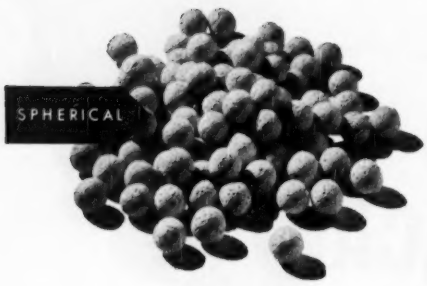
- High purity
- Chemically and physically inert
- High adsorptive capacity
- Low density
- Free flowing
- Surface areas up to 1000 square meters per gram

Typical Uses

- Anti-caking agent in dyes, chemicals, foods, pharmaceuticals
- Decolorization of organic compounds
- Pigment extenders and flatting agents
- Dehydrating agent in aluminum paint
- Insecticide diluents
- Increasing porosity of medicinal tablets
- Selective separation of pharmaceuticals and hydrocarbons

Typical Analysis on Dry Basis

99.71% pure SiO_2



Where cost of materials is a primary factor and contaminant compounds will not affect your process, Davison silica gel can be supplied in less pure form. The material is also available in greater degrees of purity for extremely sensitive processes.

CELANESE* U.S.P. FORMALDEHYDE

Shortage?.. No!

The basic position of Celanese as one of the largest producers of multipurpose FORMALDEHYDE is your assurance of a continuous supply of U.S.P. FORMALIN in spite of increased demands. The Celanese process is independent of other chemicals such as methanol. Our U.S.P. FORMALIN is produced in a steady flow by the direct oxidation of natural gases. The abundant supply of these gases, plus greatly increased production facilities at the Chemcel petrochemical plant at Bishop, Texas, are your constant guarantee of reliable and continuous supply and service. Your FORMALDEHYDE problems can be solved by Celanese.

You can depend too on Celanese U.S.P. FORMALDEHYDE for a high quality product—water white, uniform strength, low acid content, low metal content. For specification bulletins, prices and samples, wire, call or write:

Du Pont POLYCHEMICALS Department makes

DIMETHYL SULFATE

$(CH_3)_2\ SO_4$

Dimethyl Sulfate

Description: Dimethyl Sulfate is a clear, colorless liquid, with a boiling point of 188.8°C. (371.8°F.). It has high reactivity toward active hydrogen compounds, and is readily hydrolyzed by water.

Uses: Dimethyl Sulfate is used as an intermediate in making vanillin for flavoring food, and in making caffeine, codeine, antipyrine and other pharmaceuticals. It is also used to manufacture dye intermediates such as anisole and methyl hydrazine sulfate, and in making the photographic developer, p-methylaminophenol.

This reactive intermediate may provide the answer to your synthesis problem

Dimethyl Sulfate is an effective methylating agent for the preparation of methyl-substituted oxygen, nitrogen or sulfur compounds. It is already being used profitably in the food, pharmaceutical and textile fields, and has a wide range of possible uses in other industries.

To learn more about the synthesis possibilities of this versatile methylating agent—perhaps to solve an immediate problem of yours—get in touch with your Du Pont Polychemicals Department field representative. He is familiar with the chemistry and present applications of Dimethyl Sulfate—and can point out the applications it may have for you.

Unique Technical Assistance

In addition to Dimethyl Sulfate, the Polychemicals Department supplies over 100 chemicals and plastics to all types of industries. Because of this unusually broad coverage, your Polychemicals representative is familiar with a variety of chemical processes in many industries. Make the most of his background by calling him in for assistance in using any of these chemicals which may seem promising to you.

More polyethylene production is planned by Du Pont in Texas, presumably at the Sabine plant. Source of ethylene has not been definitely decided upon, but chances are that it will come from a large new installation being planned for Port Arthur. Bakelite's new polyethylene unit is expected to be producing next July.

A rise of about 10% in domestic citric acid capacity is promised by Miles Laboratories' new submerged-fermentation plant now under construction at Elkhart, Ind. The plant will be operated by Sumner Chemical Co., Miles's wholly-owned chemical manufacturing subsidiary. Miles formerly bought the acid for its Alka-Seltzer production. The process has been tested for a year in a pilot-plant unit. Miles's process, as mentioned, is deep-fermentation, whereas Pfizer's is thought to be shallow tray fermentation. Pfizer is currently the only synthetic producer, but citrus processors recover the natural product from waste fruit.

* * CI * *

You can expect to hear more about a potent new insecticide, Heptachlor, now being tested by Velsicol Corp. Closely related to chlordane, it has shown excellent results against roaches, flies, mosquitos, grasshoppers, soil-infesting insects and cotton pests. While it has residual action, it is more volatile than many currently used synthetics and is thus expected to alleviate the problem of toxic residues on edible crops.

A combination of a fatty amine with acrylonitrile, tradenamed Duomeen T by its maker, Armour & Co., has recently been put on the market as an asphalt additive. Having stronger cationic properties than Armour's other fatty amines (Armeens), it enhances the bonding between the asphalt and gravel or other kindred materials and thus prevents water erosion of roads. It is used in small concentrations (about 1%) and is sold to asphalt makers for 46¢/lb.

Another Armour chemical, Arquad 2C (a long-chain quaternary ammonium salt), is now being field-tested as a corrosion inhibitor in secondary oil recovery. A few parts per million of the chemical not only prevents corrosion of the shaft but also inhibits growth of bacteria that plug up the pores in the oil sands.

* * CI * *

Heico, Inc., Stroudsburg, Pa., is expanding pilot-plant production of sodium ammonium thiosulfate to an annual 4,500 tons. (Process is covered by

the company's U. S. Patent No. 2,475,616.) The new chemical has several advantages, thinks Heico, that will enable it to compete with sodium thiosulfate ("hypo") as a photographic fixing agent: faster, more soluble, stable up to 180 F.

Universal Match Corp. is now making water-resistant book matches at its St. Louis plant. The striking surface is chemically treated rather than the match heads. During the war the company made waterproof stick matches for the armed services, but peacetime demand is for book matches.

* * CI * *

Shortage and NPA control (see p. 585) of glycerin has caused consumers to scurry for substitutes. That may be a contributing factor in Atlas Powder Co.'s current expansion of sorbitol capacity. A 50% increase was completed early this month, and an equal additional increase is slated a few months hence.

First of a group of fungicides to be manufactured by Velsicol Corp., Chicago, is 2-methyl-1,4-naphthoquinone. Useful also as a vitamin K5 (2-methyl-1,4-diaminonaphthalene) intermediate, the compound is now being made in pilot-plant quantities. It has vitamin K activity in itself, but it has been tested and recommended primarily as a fungicide.

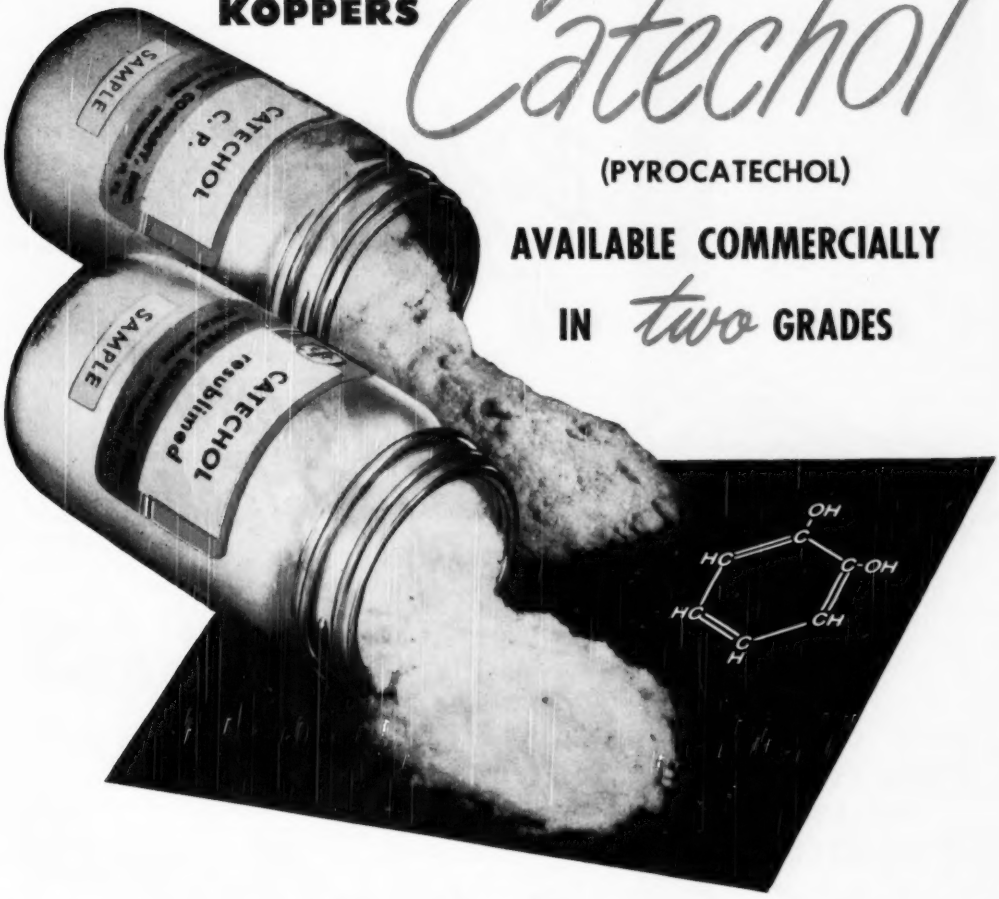
* * CI * *

Shortage of melamineresin is due to curtailment of power available to North American Cyanamid Ltd. (American Cyanamid Co. subsidiary), Niagara Falls, for making calcium cyanamide, precursor of melamine and several other nitrogen derivatives--hydrogen cyanide potassium cyanate, dicyandiamide, acrylonitrile, etc.--made by American Cyanamid.

Now being introduced by Velsicol Corp. is a new hard wax, Syrex 200, suitable for buffing polishes, self-polishing floor wax, water-repellent formulations, and floor sealers, and as a replacement for costlier waxes (Syrex is in the 20¢-25¢/lb. range) in marking crayons, carbon paper, inks, and insulation compounds. Light amber in color, it melts at 180-190 F.

* * CI * *

Here and There:



New use for sequestering agents of the ethylendiamine-tetra-acetic acid type (Alrose, Bersworth, etc.): decontamination of radioactive materials....Pennsylvania Salt Mfg. Co. is bringing in a new agricultural chemicals plant at Montgomery, Ala....Shell Chemical Corp. is again expanding ammonia capacity on the West Coast....Increased demand for Vicara, Virginia-Carolina's vegetable protein fiber, has necessitated a substantial upping of output at the Taftville, Conn., plant....Shut down for some time, the caustic-chlorine unit at Denver's Rocky Mountain Arsenal is to be reactivated by Julius Hyman & Co. this month for limited production....Improved moisture resistance of cellophane is the goal of research to be carried out in two new buildings, costing $500,000, slated for completion next March at Du Pont's Old Hickory (Tennessee) plant.

The Editors

KOPPERS *Catechol*

(PYROCATECHOL)

AVAILABLE COMMERCIALLY IN *two* GRADES

● Facilities of Koppers Chemical Division make this industrially important chemical readily available to you in two commercial grades — C.P., with a minimum purity of 99.0% and Resublimed, with a minimum purity of 99.6%.

Catechol currently has a wide range of important applications—in preparation of dyestuffs and medicinals, in photography, as an oxygen-removal agent, in specialty inks and in the production of antioxidants for rubber and lubricating oils.

Resublimed Catechol is largely used for medicinal, pharmaceutical and photographic purposes, while the C.P. grade is usually suitable for most other chemical manufacturing and processing uses.

The ready availability of this once-scarce organic chemical, together with the wealth of background information on its properties resulting from extensive investigation, recommend it for further study in your laboratories.

FOR FURTHER INFORMATION . . . write for your copy of Bulletin C-9-127. It contains full details on the properties, uses and reactions of Catechol. A four-ounce sample of Catechol will be sent to recognized laboratories when requested on their letterheads.

A NEW RESEARCH CHEMICAL SERVICE

by **W. ALEC JORDAN, Editor**

THERE'S A RESPECTED axiom of the chemical industry which neatly categorizes satisfaction and stagnation as synonyms. Any chemical maker, or any chemical consumer, who is smugly satisfied with his products and processes, who ignores the basic need of constant appraisal, evaluation and research, stagnates.

The same precept is held, of course, by those of us who, by our publishing activities, strive to serve the chemical process industries. That is why CI has long maintained a continual and continuing research program—a program designed to determine the important needs of chemical men—your needs—and how we may serve you better in your day-to-day activities. One of the fruits of that research is in your hands this month—the new Research Chemicals department of the Buyer's Guide.

This issue of Chemical Industries is, as you know, a double edition divided into two main sections. The first section, our regular monthly issue, you are now reading. Section two, which accompanies it, is an 800-page "chemical encyclopedia"—the 26th revision of CI's annual Buyer's Guide. Therein this year is included an important and completely new feature—our first compilation of several thousand chemicals, both organic and inorganic, *available only in research quantities*, together with the names of their manufacturers.

This new feature is designed for your use. It includes 2,904 compounds and runs a full 12 pages.

The creation of the Research Chemicals Department stems directly from dissatisfaction—the healthy dissatisfaction of CI's editors with previous editions of the Guide.

The fundamental purpose of the Guide had been, for some twenty-five years, clearly defined: To assist its users to locate sources of supply for *commercial* chemicals and raw materials, chemical specialties, processing equipment and containers. (Of interest to the statistically-minded: The new edition lists 3,544 *commercial* chemicals and raw materials, 1,003 chemical specialties, 1,542 types of equipment and containers.)

Every year new listings were added as new products attained commercial stature. In some cases, the period between the development of a new chemical and its becoming industrially important was short and, correspondingly, it became eligible for inclusion in the Guide at an early date. (DDT and penicillin, for instance, "made" the Guide while the first plants were still being built.) But in many other cases the "commercial" requirement constituted a real limitation on the service the Guide could render.

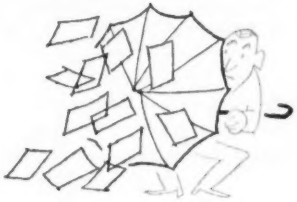
Apparently, with the swelling stream of research chemicals pouring from the nation's laboratories, a new, broader service might well be inaugurated. Field surveys confirmed the editors' belief. So did an analysis of the hundreds of requests for assistance which are received regularly by CI's Technical Data Service Bureau. An extraordinarily high percentage of these inquiries were of one type: where to buy rare, or unusual, chemical compounds.

Last Fall, former editor Robert L. Taylor assembled a special staff to develop the Research Chemical feature. Questionnaires were mailed to all chemical producers of which we had record. The returned questionnaires, processed through IBM machines, were collated. The result, in the new Guide, is a listing of research chemicals running the gamut from Acetaldehyde Sodium Bisulphite to Zinc Thiocyanate.

This initial compilation is, to our knowledge, the only such work in existence. It is as comprehensive and accurate as care and diligence could make it. However, although IBM machines may not be fallible, editors most certainly are. Quite possibly some mistakes have been made.

You, as a user of the Guide, can best appraise its attributes and shortcomings. Work is already under way on next year's edition. That is why, now, we solicit your comments, criticisms, suggestions.

They will help us to make the entire Guide, and especially the new department, of greater service and usefulness to you.



Believe us, it's no fun having too much business.

We're swamped with orders—a dazing, devastating deluge. This is not due to war orders but to an accelerated rate of industrial and consumer buying.

Naturally, our regular, old-time customers come first. But, alas, everybody is out after us for material.

No one dislikes this embarrassing situation more than we do. We hope it won't last very long.

Our production men are working themselves to a frazzle to increase output. More material will be coming your way. Meanwhile, remember that we are treating everyone as fairly as possible.

Remember, too, that we love you. For being angels of understanding and cooperation, we think you deserve a halo.

What's new

BUTTER AND GUNS

Government and industry chiefs work overtime seeking ways to sate defense and civilian chemical needs. Both must be served . . . but how?

WASHINGTON: Midnight oil brings haze.

A GROUP of men whose names sound like a "Who's Who" of the chemical process industries descended late last month upon Washington, at the invitation of W. H. Harrison, newly appointed head of the equally new National Production Authority. Object of the meeting: to provide a get-acquainted session for government and industry men. Subjects: the tight demand-supply situation in chemicals, tankcar shortages and NPA provisions for expanding production.

Expansion is Consensus

Both sides agreed that production capacity must be expanded if domestic and military needs are to be met. By this they meant a simultaneous 100% supply for each. This is directly in line with current Washington thinking on the whole subject of production control: "Butter and guns both . . . we can do it!"

The subject of tankcar shortages plowed worry-furrows in brows on both sides of the table; all felt this situation will get worse before it improves. Industry representatives suggested that the World War II arrangements on tankcars, which included efficiency measures to reduce long hauls of empties, could be revived.

But this first meeting was somewhat shallow in accomplishment, mainly because no one was able to state how much expansion of chemicals production would be required. Industry knows the civilian needs which consume practically all of its present output. But business men can't determine defense requirements. Harrison, who is also president of International Telephone and Telegraph, explained that "the full impact of the accelerated defense program on the availability cannot be anticipated at this time." Officials of NPA added that at the time of the meeting the Defense Department had not submitted breakdown figures for the planned military force of 3 million men.

Everything depends, of course, on the two big "K's" Korea and the Kremlin. American successes in the first may upset or delay planning by the latter. But there is every evidence that the NPA will continue its existence and caution-based controls for some time—until or unless another global war boosts it into the driver's seat of all the nation's production.

The NPA will operate as a primary unit of the Department of Commerce. In fact, the controls agencies that comprise it were lifted bodily out of the Office of Industry and Commerce and placed under the direction of Harrison. But according to the master plan, insiders claim that men will be brought in from industry to staff certain key posts. Harrison and Secretary of Commerce Sawyer are now holding meetings with various industrial leaders to pick individuals acceptable to both the government and the industries concerned.

The chemicals division of the NPA is at present headed by C. C. Concannon, veteran government chemical official and head of the Chemicals Division of the Department of Commerce. But due to the pressure of Concannon's other duties, it is possible that an industry man will be named shortly to relieve him of NPA chores. This seems to be the prescription that will be used along the rest of the line; an industry man will almost surely be brought in to head up each of the groups charged with the control of specific items.

Business as Usual

At this writing the NPA chemicals group is concerned only with industrial alcohol (ethyl); benzene (benzol); caustic soda in all grades, liquid and solid; chlorine, gaseous and liquid; glycerine, crude and refined; and soda ash, all grades.

But even on these there is a tendency to go slow and keep a "business as usual" attitude as much as possible. There is no desire, no intention and no staff available to step in and do any great immediate allocating of basic chemicals. As one veteran Washington reporter put it, "Even the thought gives the NPA staff the shudders."

The Department of Defense has

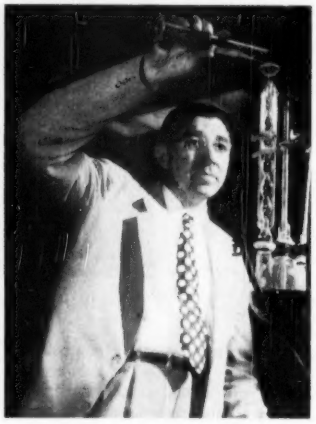
been doing some heavy thinking about the military future of chemicals, but most of this planning has been devoted to the organization of procurement facilities. And in a recent speech in Chicago before the Armed Forces Chemical Association, Major-General Anthony C. McAuliffe, of the Chemical Corps, revealed some interesting facts and figures on the whole situation.

When the Korean situation broke, he said, the annual appropriation of the Corps for the fiscal year 1951 was pending before the Senate. The House had already approved an appropriation of $36 million which was based on keeping defense expenditures for 1951 at about the same level as 1950. But the new demands in Korea made President Truman request $10 billion in supplemental appropriations for the Department of Defense to support combat operations. Of this amount, McAuliffe said that $31 million was earmarked for the Chemical Corps for the main purpose of replenishing shortages. But, he added, these funds will not be available for contract purposes until approved by Congress.

Procurement, Allocation, Production

The general who also made headlines in World War II went on to explain that the overall responsibility for the industrial mobilization program of the Department of Defense rests with the Munitions Board. Based upon the experience gained in World War II the design of the military aspects of this program are listed in four categories: maintenance of reserve plants, acquisition and maintenance of essential machine tools and manufacturing equipment, planning studies and industrial preparedness measures, and planning within the Department of Defense.

Under this plan the Chemical Corps is authorized to procure all chemical supplies, not only for other arms and services, but also for the Navy and Air Force. This means that the Chemical Corps is charged with meeting the chemical portions of the overall strategic plans of the Joint Chiefs of Staff, a responsibility that brings greater procurement efficiency for defense purposes but which also places a huge load on the shoulders of the Chemical Corps.



But though the load of procurement may be on the Chemical Corps, and the load of allocation on the NPA, the load of production will land right where it always does—on the broad shoulders of the chemical process industries.

ACRYLIC GOES DRY

First commercial production of dry acrylic acid promises to add new names to the roster of acrylate manufacturers.

BIG SPLASH in product development this month was made by the opening of a new plant devoted exclusively to the production of glacial acrylic acid. Formerly available in limited quantity at prohibitive cost, this problem child has finally met its masters in B. F. Goodrich Chemical Co.'s research laboratories.

Acrylic acid is no novelty to the chemical industry. Although industrial acrylics are of fairly recent origin, the acid itself was first manufactured over a century ago. Never achieving widespread manufacture in the United States, interest remained concentrated among relatively few manufacturers.

GRESHAM AND WARNER: Water was a nuisance.

On the other hand, the Germans devoted a great deal of attention to acrylic and came up with many interesting applications to such products as thermosetting resins, leather finishes and printing inks. However, neither in this country nor abroad was the acid prepared in its glacial form until early 1949 when Monomer-Polymer, Inc., offered it in research quantity at $19 per 500 grams.

Time Saver

Agreement over the advantages of a dry product was universal: it could be esterified directly with an alcohol, eliminating the time-consuming ester-interchange procedure; it could be used as a monomer in polymerizations conducted in organic solvents; it could be used in bulk polymerization for resin casting; its salts could be prepared more easily; it would be more stable and economical in shipment and storage. The big question was, How to make it?

Ever since 1944, when research under the supervision of genial research director Tom Gresham terminated in a patent on β-propiolactone, Goodrich has been eyeing the possibility of entering the acrylic market. Made from formaldehyde and ketene (*CI, Dec. 1947, p. 977*) and easily converted by a patented pyrolytic isomerization of its polymeric form to the desired product, β-propiolactone provided the chemical approach to the problem, but the difficult technological hurdles were yet to be cleared. Engineering know-how mobilized under the able leadership of A. B. Japs and plant manager, Harry Warner, did the trick and this September glacial acrylic was pouring out of the firm's Avon Lake General Chemicals Plant in tonnage lots.

β-Propiolactone is not the only solution to the acrylic puzzle. A Reppe synthesis using cobalt carbonyl to catalyze a reaction of acetylene, carbon monoxide and water is another possibility, but as yet no one in this country has taken this idea out of the laboratory. It is interesting to note that a method for production of cobalt carbonyl has recently been patented by the Rohm and Haas Co.

In the Army

The new product is expected to find wide application in the preparation of high-molecular-weight acrylate monomers, which are used in the manufacture of pressure-sensitive adhesives, rubber and plastic modifiers, surface coatings and lubricant additives. In addition, glacial acrylic acid facilitates the preparation of such solid mono-

mers as calcium acrylate, now undergoing Army tests as a soil hardener for use in the high-speed construction of roads and emergency airfields. Other outlets for acrylic derivatives are as textile sizes, in printing inks and leather finishes.

Selling in ton lots at $1.15 a pound and in drums at $1.25, the material is more than 97% pure and contains less than 1% water. Although the cost will undoubtedly be reduced substantially as production increases, the new price is a far cry from the old rate of $19 a pound.

Expansion of the acrylate field will in all probability follow large-scale introduction of this new intermediate. Making the most of the numerous advantages of the dry product over its damp predecessor, many firms will find it comparatively easy to get their foot in the acrylate door.

VISIBLE SUCCESS

Small-town manufacturer is making "safety first" more than a slogan with popular eyeglasses cleaner and defogger.

AMERICA'S 71 million eyeglass wearers as well as scores of industrial organizations are all potential customers of the Wilkins Co., Cortland, N. Y. Formed in 1937 for the sale of laboratory products, this modest enterprise has come up with a couple of products which promise to put Cortland on the map.

It all started with a lens cleaning preparation which a chemist friend of president Ralph R. Wilkins had developed and was trying to market. Normally a cautious fellow, unspectacled Mr. Wilkins took a sample of the fluid home to his wife to try on her own glasses. She approved and so did the neighbors. Inquiries on where to buy the product sparked the business instinct in Wilkins, and he was soon busy bottling the recipe in his cellar. Early in 1940 he started distributing the formula from his cellar stockpiles, tagging it K-Lens-M. Much to the delight of all concerned, the product found an eager market and Wilkins was in business.

Out of the Cellar . . . .

There is nothing very new or revolutionary in the idea of spectacle cleaners. Lots of them have appeared on the market through the years, generally with little success. Dow-Corning's silicone tissues have been a notable exception, but it would be difficult to name another. Although

RALPH R. WILKINS: His wife approved.

K-Lens-M did as good a job as any, its real boost came not from the astigmatic public, but from industrial safety engineers who seized upon it as the key to the problem of getting workers to wear the goggles provided for their protection. During World War II, the safety people approached Wilkins with the idea of putting his lens preparation into a cabinet complete with sprayer and wiping tissues. The hope was that such an innovation would make it easy for anybody to keep his goggles clean, thereby promoting more widespread use of visual protective devices. The scheme went over like oil on water and the new dispensing units were rapidly taken up by plant owners large and small, including a major Detroit automotive manufacturer and one of the world's largest chemical companies. The printing industry found an interesting use for the cleaner in removing ink mist from the glasses of press workers, and a sizable volume of the potent potion is now allotted for that purpose.

Early in 1950, the safety engineers again called on their erstwhile benefactor. This time for a certain "something" that would keep optical surfaces free of blinding fog that made clear vision a virtual impossibility in many jobs requiring the use of goggles and shields. The only hitch was, nobody had ever perfected a material of this type that would stand up in actual use over any extended period of time. Undaunted, Wilkins took his problem to the big city and left it in the hands of Evans Research and Development Corp. After more than a hundred tries, the project headed by youthful Evans researcher Murray Berdick hit the jackpot, and the brand new creation came into the world bearing the name Fog-Free*.

* Trademark registered in the U. S. and Canada.

The novel product is best described as a liquid surface-active silicone composition which facilitates the formation of a durable fog-preventing film on both glass and plastic surfaces. Applied by spray and polished on the lens, the film, while effective in rendering surfaces free of fog for hours at a time, is invisible and does not impair vision. In both laboratory and field tests, Fog-Free came through with flying colors and was soon installed in the handy dispensing cabinet as a companion to its more prosaic cousin. Now in commercial production, it is doing its duty in such diversified surroundings as ice cream plants and foundries.

. . . Into the Chips

Priced at $1.50 for a six-ounce bottle, the newcomer found a tailor-made market among the sizeable Wilkins clientele in this country and Canada. Even Europe has jumped on the bandwagon with several orders from Switzerland.

Plans for further expansion, now in the making, are bringing fog-free visions of happy days to Wilkins.

ALKALI PATTERN

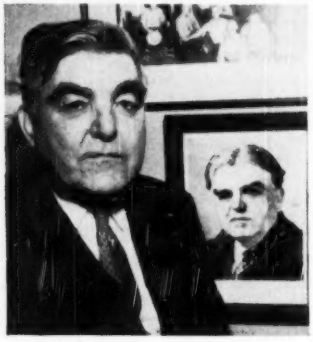
Conditions of soda ash strike settlement will influence future chemical labor negotiations.

COAL has its Lewis—John L., that is—but soda ash, not overlooked in the bestowal of dubious distinctions, also has its Lewis—John's kid brother A. D. (Dennie), head of the United Mine Workers' "we'll-organize-anybody" District 50.

Envious, perhaps, of his elder brother's success at wringing management concessions for the coal miners, Dennie Lewis tested his strength against Solvay Process Division of Allied Chemical & Dye Corp. (three plants: Syracuse, N. Y.; Baton Rouge, La.; Detroit, Mich.) and Diamond Alkali Co. (one plant: Painesville, Ohio). Workers at Wyandotte Chemicals Corp.'s three Michigan plants also walked out, but they returned to work after a few days to await the Lewis-Solvay pattern-setting settlement at Syracuse, the largest struck operation.

What They Asked

District 50 demands on Solvay were closely similar to those won by John L. for the miners: a funded pension ($100 monthly minimum, exclusive of social security benefits) administered jointly by company and union; substantial pay raises—reportedly 15¢



across the board; an 18-month contract; and no no-strike clause.

Solvay, on the other hand, wanted a 3-year contract with nickel raises each year together with cost-of-living bonuses; company-administered pensions with the same minimum but including social security; and a no-strike pledge.

What They Got

The compromise settlement gave the workers an immediate 10¢ raise and another nickel next June, plus a quarterly cost-of-living adjustment based on 1¢ for every point rise in the Bureau of Labor Statistics' index. The contract runs until June 12, 1952 —two years from expiration of the earlier pact. Workers voted 8 to 1 to accept the new contract.

Pensions were dropped from discussion in the final contract, but the company will improve and modify its present plan to provide minimum $100-a-month pensions for 25 years' service, the rate increasing with length of service and rate of pay. Under company control and including social security benefits in calculation of the amounts, the pension plan will provide for voluntary retirement at 65, mandatory at 70. (Provisions will be ironed out for retirement before 65.)

DENNIE LEWIS: Workers may look twice.

Diamond Alkali and the District 50 local took a look at the Syracuse settlement and settled their differences on much the same basis. Management conceded a higher minimum pension ($110) and received in turn a longer contract (three years, and another nickel raise the third year). Other provisions hewed close to the Syracuse line.

At this writing, the Solvay settlement is final only at Syracuse. The Detroit union is still negotiating its new contract, but ash production there —manned by supervisory personnel— has crept up to a third of capacity.

The Baton Rouge workers are back on the job at the union's behest, and their contract doesn't expire until this month. Since the contract was in force during the strike, Solvay wasn't obliged to make any wage concessions when the strike was called off, and the union permitted the company to refuse to rehire strikers reasonably suspected of violence during the shutdown.

AFL Throws Monkey-Wrench

No friend of either of the Lewises, the American Federation of Labor (both the Chemical Workers and Dave Beck's Teamsters) hobbled settlement efforts at Diamond Alkali by filing for a bargaining-rights election with the National Labor Relations Board. Since UMW chiefs had refused to comply with Taft-Hartley's non-Communist affidavit provision, the union was ineligible for inclusion on the ballot. UMW adherents thus had to join non-unionists and vote for "no union," and since "no union" ballots were in the majority, the "non-unionist" group with which the company settled is actually the potent but legally invisible District 50.

The AFL Chemical Workers and an independent union are reportedly preparing to petition the NLRB for a similar election at Baton Rouge. If so, negotiations now due will be postponed well beyond the contract deadline.

Policy of Attrition

At Syracuse, it looks as if Dennie Lewis followed a deliberate policy of attrition. It wasn't until the 88th day of the strike, which started in June, that the union clarified its demands. After that it didn't take long: the pension issue was dropped on the 93rd day, the union accepted the no-strike clause on the 96th day, and final agreement was reached on the 102nd day.

Whether or not the long delay strengthened the union's hand, it certainly played hob with the alkali market. Many consumers felt the pinch (*CI Newsletter, August 1950*) and recent price increases in ash and related caustic products reflect higher production costs. Light ash rose 20¢ per cwt to $2.40; chlorine jumped $3 per ton to $54; and 50% rayon-grade caustic solution went from $2.50 to $2.65 per cwt.

Boom or Bust

The Syracuse settlement will probably set the pattern at Detroit and Baton Rouge. Other chemical producers who deal with District 50—Wyandotte Chemicals and Solvay's Hopewell plant, for example—can expect similar demands when present contracts expire.

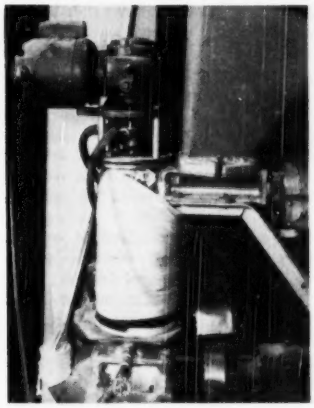
But District 50 has more than once bit off more chemical workers than it could chew. It once represented Du Pont workers at Belle, W. Va.; and was bargaining agent for the Barberton, Ohio, plant of Pittsburgh Plate Glass Co.'s Columbia Chemical Division for eleven years—from early 1948 until January 11, 1949. After four strikes during a three-year period, culminating in a 77-day shutdown in 1948, the fed-up workers voted to be represented by the independent Allied Chemical & Alkali Workers of America, Local No. 1. The new union won a contract from management that provided many of the benefits just won by Lewis at Syracuse and insured uninterrupted paychecks for three years.

In most plants the big unions do the bargaining, but over-ambitious or over-frequent bids for power could prompt the workers—like Columbia Chemicals' 1200—to look again.

FREEZE-GRINDING

Cooling tough materials with liquid nitrogen makes them easier to grind.

THE "deep freeze" was a political liability a couple of years ago, but now it's a chemical processing asset. Linde Air Products Co. researchers have come up after three years' work with a freeze-grinding technique wherein difficult-to-grind materials are frozen into submission by liquid nitrogen.



Tough polymers, like saran and polystyrene, are cooled until they become brittle; then far less energy is required to fracture them into powder. A small (5 hp) hammer mill can grind as much as 700 lb./hr. An Elizabeth, N. J., firm, Pedry Process Co., is already freeze-grinding plastics on a production basis.

No Loss, No Explosions

Resilient materials that become brittle on cooling are obvious recruits for the new technique, but other types of materials also stand to benefit: low-melting materials that would melt with the temperature rise of grinding; heat-sensitive substances like insecticides, glandular products and many pharmaceuticals; oxygen-sensitive materials that will do better under a nitrogen atmosphere; explosives; and volatile chemicals, foodstuffs, and the like.

Also, nitrogen cooling will permit higher production rates with no increase in rated grinding capacity.

In operation, liquid nitrogen from a

FREEZE-GRIND SET-UP: Toughies become submissive.

portable source is injected into a special heat exchanger installed between the feed hopper and a high-speed stainless-steel pulverizing mill. The nitrogen is sprayed directly on the material as it passes to the mill, cooling it by direct-contact heat transfer and simple evaporation. Being a liquid, it cools substances more rapidly than solid refrigerants because heat transfer is more efficient; being inert and passing off as a harmless gas, it can be used in direct contact with other materials.

The cold gaseous nitrogen resulting from evaporation is used to precool the material in the feed hopper, and thereby it also excludes the surrounding air, which would raise the temperature and play hob with oxygen-sensitive substances.

Liquid nitrogen has a higher cooling capacity than is ever needed: It can maintain a temperature of —320° F, but no material processed so far has required such extreme frigidity.

Freeze-grinding is pretty well limited to fairly expensive materials that can absorb the added cost. How much that cost will be depends on the type of product to be ground, scale of grinding operations, and proximity to liquid nitrogen supplies. Some localities are pretty well ruled out. Pulverization of granular ethyl cellulose consumes 1 lb. of liquid nitrogen per 9 lb. of final grind. A tougher material may require as much as 5 lb. of nitrogen per pound of grind, and a friable material such as 100% DDT may use only a pound of refrigerant for 10 to 20 lb. of material.

Linde's engineers have worked out a process adaptable to customers' needs, and they hope there are lots of needs that only freeze-grinding can solve.

NOW LOOK AT THREE

Tennessee Eastman Corp. adds a new water-soluble cellulosic, sodium cellulose sulfate, to compete with methyl and carboxymethyl cellulose.

EVERYONE knows that if you treat cellulose with sulfuric acid, all you get is a thick, black "gunk." Tennessee Eastman Corp.'s researchers knew it too, but they didn't accept it.

Lush Pastures

They figured out a way of reacting sulfuric acid with cellulose to give cellulose acid sulfate (with about one sulfate group to every three anhydroglucose units), which, neutralized with sodium hydroxide, gives a new, water-soluble cellulose gum, sodium cellulose sulfate—logically dubbed SCS.

Tennessee Eastman's interest in cellulose derivatives is natural enough, but for several years it had cast a covetous eye at the many customers for water-soluble cellulose gums, all of whom were perforce grazing in its competitors' lush pastures.

The Dow Chemical Co.'s methyl cellulose was one of the first and is still one of the foremost materials of this class. In late 1946 sodium carboxymethyl cellulose vaulted into prominence and a year and a half later (*CI, May 1948, p. 733*) Du Pont and Wyandotte Chemicals Corp. had joined Hercules Powder Co., the first maker, in turning out the material. Since then CMC has shot up in output and shot down in price (50-60¢ lb. then, 38¢ lb. now). While it is employed in many industries for a variety of purposes, its chief use is as a synthetic detergent builder: Over 90% of all synthetic detergents now contain CMC.

SCS's Assignment

To capture some of that market is SCS's assignment, and it appears well qualified to carry out that task.

It is logical to assume that eventually it can handily compete on a price basis. Production is still on a limited pilot-plant scale, so a current cost quotation would be meaningless. But sulfuric acid is certainly far cheaper than monochloroacetic acid, the intermediate for CMC, and the process—at least on paper—is obviously simpler. On a comparable production basis, then, it would be low-priced.

Also, like CMC, it can be made in various viscosity types. Two are presently available: medium (300-1,000 cp at 2%) and low (20-70 cp at 2%). Tennessee Eastman suggest SCS as a thickening agent. Many non-Eastman experts think that to be used thus, a cellulose gum should have a viscosity of over 1,000 cp at 1%; if they're right, Tennessee Eastman will have to offer a high-viscosity type to compete in that field.

Uses Coincide

SCS is physically and chemically so similar to CMC that its potential uses are practically the same.

One use for which SCS is not yet qualified is as a thickener and protective colloid in foods and pharmaceuticals. But that's only because toxicity tests haven't been completed. There's no reason to suspect that it might be toxic, and preliminary tests on animals—which are being fed a diet containing 20% SCS by weight—bear out the assumption that it's perfectly safe. A purified grade will be desirable for food, cosmetic, and pharmaceutical uses, of course. Present production, a technical grade, is light tan in color.

SCS will compete with CMC as a detergent builder, wherein their protective colloid action prevents redeposition of soil on the textile surface.

As a thickening agent, SCS may find its way, like CMC, into emulsion paints, ice cream, salad dressings, puddings and pie fillings; in the paper field, as a grease- and oilproof coating material; in textiles, as a warp size, finishing agent, and scaffolding fiber; in drugs and cosmetics, in the preparation of greaseless creams, lotions and ointments, and water-soluble capsules.

The Textile Research Institute,

SCS SOLUTION (3%) AND FILM: A covetous eye.

Charlottesville, Va., has come up with some data that could mean a big market for CMC, and presumably SCS too, if . . .

Researchers there found that if CMC is added in very small concentration to the rinse water when washing cotton clothes, an invisible CMC film is deposited on the fabric surface. This film catches the dirt, and at the next washing the film, together with the dirt, literally pops right off.

The Big If is double: Will the housewife or commercial laundry spend the extra pennies? And will the automatic-minded housewife disturb the automaticity of her basement Bendix to the extent of trying to add material before the rinse cycle?

Even if that bright idea doesn't pan out commercially, there's still plenty of room, however, for SCS to join battle with CMC and other water-soluble gums for the many consumer's many orders.

NYLON INSURANCE

Polyvinyl plastic adds to the life of nylon hose.

AIMED at the ladies, a product designed to preserve nylon hosiery is making its appearance in Eastern outlets after a year of sales development in California and the Southwest. Composed of a polyvinyl acetate emulsion and various other ingredients intended to coat the nylon fibers and thus reduce their susceptibility to snags and runs, it goes by the name of Plastette.

A brainchild of Earle A. Goodenow, Sr., of Oklahoma City, the product has achieved favorable results in tests conducted by a New York consulting outfit. Stockings treated with the emulsion were found to have greatly reduced snag tendency at no loss to touch or appearance.

Fifty Pairs for a Dollar

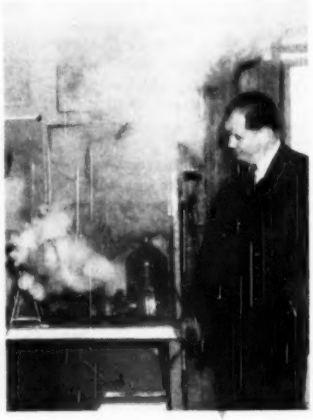
Selling for one dollar, the liquid comes in three-ounce bottles to be diluted for home use. After rinsing, nylon stockings are dipped in a dilute solution of the emulsion and thoroughly wrung out. The contents of a bottle will treat 50 pairs if used according to instructions.

A further application for this unique product is the treatment of nylon goods during manufacture to produce a fabric more resistant to the stresses and strains of everyday wear. Exploration of this possibility has already been made by a Tennessee stocking manufacturer and results, although inconclusive, are encouraging.

Produced by G-M Liquid Plastics, Ltd., of Oklahoma City and Montreal, Plastette has a fertile field for commercial development in the half billion pairs of nylons sold each year. If the gals go for this old-age insurance for stockings, vinyl emulsion makers will have another sizable specialty outlet.

YANKEE ENTERPRISE

New company, formed to manufacture high purity aliphatic derivatives, adds custom sodium reduction service.



"I'D LIKE to bring some of my engineers out here to see what can be done." That was the comment of the executive of a large oil company when he saw the new sodium reduction unit that Bing Humphrey and John Wilkinson have just completed at their plant in North Haven, Conn.

A sodium reduction unit with a 400-gallon kettle doesn't sound like the sort of operation that would stir an oil company big-wig. But Humphrey and Wilkinson, hardly engineers,* not only designed the unit, but went shopping in junk yards for used steel beams, pipe, vessels, etc. (only one piece of equipment, a condenser, was store-bought) and then put it up themselves. Justly proud, but not over impressed with the accomplishment, Wilkinson surveyed the new structure, sucked on his pipe, and modestly replied, "We've got a dandy of a welder working for us though."

Doing things like that is old stuff to opportunists Humphrey and Wilkinson. When they first looked over the five-acre site on which their operations are starting to expand, they found an old well that years ago had supplied drinking water for the mules which a previous occupant (a brick company) had stabled there. Now completely unearthed and cleaned out, it is still the company's only source of process water.

How these two chemists started their manufacturing business (there are two other principal owners) goes back to the time Connecticut Hard Rubber Co. hired Humphrey, then head of the organic group at Firestone Rubber Co., to develop some chemical manufacture. Because of his background, Humphrey soon had its chemical division turning out aliphatic derivatives, many of which had never been available before in the high purity being offered.

* Bingham J. Humphrey is a Yale chemistry Ph. D.; J. W. Wilkinson's graduate work became a depression casualty after he had earned a master's degree in chemistry at Washington U., St. Louis.

B. J. HUMPHREY: Versatility and good intermediates.

Far Cry From Rubber

Humphrey induced Wilkinson, who had been a chemist for Winchester Arms, to join the company, and in 1948, when Connecticut Hard Rubber decided that the business was too unrelated to its other operations, the two took over as Humphrey-Wilkinson, Inc. After a year's progress in hired space in New Haven, they established their present plant a year ago last June.

Current expansion is a direct outgrowth of vigorously following the course charted by Humphrey—development of a versatile chemical manufacturing business by producing specialty chemicals. For production of olefins, saturated hydrocarbons and alcohols in the C_6-C_{18} range, as well as related ethers, mercaptans and thioethers of high purity, the company uses commercial fatty alcohols. These raw materials are purchased from suppliers who produce alcohols from natural glycerides—usually coconut oil—either by sodium reduction or catalytic hydrogenation. These companies strip off the alcohols they require for their own use—principally C_8's and C_{10}'s for detergent and plasticizer manufacture—and sell the remaining mixture of fatty alcohols. H-W rectifies such mixtures to produce pure high alcohols for sale as such and as raw materials to be dehydrated to the corresponding olefins, some of which in turn are also hydrogenated to saturated hydrocarbons.

Do It Yourself

Since the company has never had enough of some of these technical

grades of alcohols to rectify, particularly in times such as these when fatty alcohols are tight, it was natural for H-W to set up its own sodium reduction unit. This particular type of reduction was chosen for, according to Humphrey, it is the only way to get an unsaturated alcohol. In addition to being able to reduce its own coconut oil when conditions warrant, the company expects to investigate such materials as fish oils as sources for some alcohols that have not been commercially available. Custom reduction service—principal users are expected to be pharmaceutical and fine chemical houses, although small soapers should be interested too—should keep both the new unit and an existing 20-gallon pilot plant busy. Another unit with a 100-gallon kettle is also planned.

The new specialty organics that H-W has developed so far have found their way around the world in one-, five- and ten-pound lots. Humphrey expected such intermediates as the terminally unsaturated long-chain compounds to be well accepted, but the saturated ones have gone over big too, and in unsuspected fields. For example, Pratt & Whitney uses pure decane to standardize aviation carburetors, and most of H-W's cetane is used as a diesel fuel standard.

Fast on Their Feet

Oddly enough, biggest customers for specialty hydrocarbons are the oil companies who may some day be cutting into H-W's business. H-W's products are of the same type as those that occur in the oil layer of the Fischer-Tropsch synthesis product, and these companies have been carrying out research against the time they'll all be making synthetic fuel. Although mixtures containing such materials may soon be in abundant and cheap supply from the Carthage Hydrocol Brownsville, Texas, plant, the separation problem—the mixture contains both saturated and unsaturated aliphatics, as well as some aromatics—will be a tough one to crack. Even when this is accomplished, H-W feels that there will still be a place for it in supplying very pure materials and special molecular configurations. There is, however, the possibility of H-W's switching to Fischer-Tropsch for raw materials.

This relatively new organization's breadth of activity leaves little doubt that it can meet any threat of chemicals from synthetic fuels plants. One of its enterprises is filling tubes with ethyl mercaptan and titanium tetrachloride for use as warning devices on

J. W. WILKINSON: Safety signals and mules.

roller bearing equipment. These are standard equipment on most railroads, giving a smell-and-smoke alarm of a "hot box" to the crew before a wreck can occur. At the other extreme is H-W's development work with reactions of maleic anhydride and olefins to prepare alkyl and alkenyl succinic acid anhydrides with various side chain lengths from C_6 to C_{18}. Some of these have found application in modifying cellulosic materials and as oil additives. In such a range of unrelated operations, there's plenty of room for two guys who can build their own plant.

WITHOUT SUBSIDY

Du Pont expands neoprene production capacity to meet "peacetime" demands.

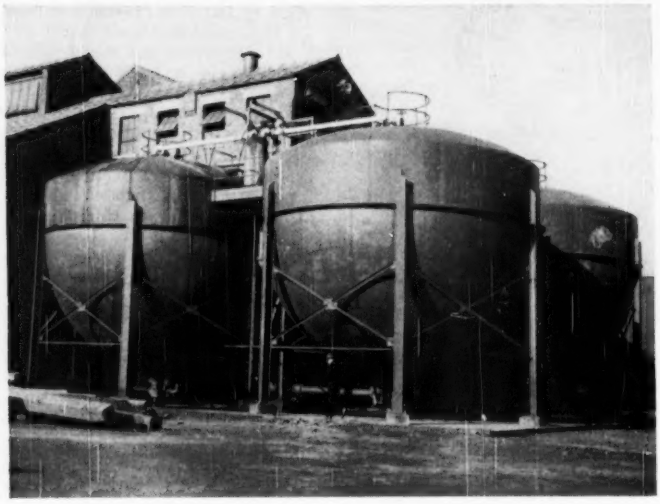
PRODUCTION of all types of synthetic rubber is booming, but neoprene's boom differs from the rest. The others are approaching their wartime peak under the aegis of government subsidy, while neoprene is at its wartime peak (rated capacity 60,000 long tons per year) and currently undergoing a sizable expansion without benefit of Washington props. Plant expansion is proceeding in two steps: Such bottlenecks as acetylene loss (in the form of divinylacetylene) are being broken first, and construction of totally new capacity is scheduled to get under way in the near future.

New Bloom

No single new use can be credited with this latest blooming of the $60-million-per-year research flower planted by Fr. Nieuwland of Notre Dame in the early '30s and assidously cultivated by Dr. E. K. Bolton and other Du Pont researchers since that time.

At first glance one would assume that neoprene is being expanded to serve as a substitute for other rubbers. This is not the case. (Its only sizable use in tires is as the rubber content of white sidewalls.) Rather, its markets depend on superior resistance to checking upon long-time exposure to light and air, and excellent resistance to solvent deterioration. Impinging on neoprene's field are GR-N and various vinyl polymers, but most other plastics and rubbers aren't competitive.

The more than 300 accounts to which Du Pont sells neoprene provide ample evidence of the multiplicity of uses where these properties have been utilized. Every major rubber processor is now processing neoprene.



Neoprene's excellent resistance to ozone oxidation and to oils and greases makes it a natural for insulating the high-tension ignition systems of internal-combustion engines. Pontiac is the first auto-maker to use it, and more will follow when sufficient material becomes available. The increasing complexity of metal-working machinery construction and the use of various chemicals in cutting oils and for solvent degreasing provide a set-up for neoprene's increasing application. Other uses range from pump impellers to shoe soles, from rubber electrical cable covering to the rubber shock absorber in automobile car doors.

No Major Problem

Raw materials required for production of neoprene promise to be in ample supply by the time current expansion is completed. Acetylene will be provided by calcium carbide from the new $10-million plant which National Carbide is planning for Louisville (*CI Newsletter, Sept. 1950*). Hydrogen chloride will be provided by more Mannheim furnaces, which prepare it from salt and sulfuric acid.

Not the End

Even more expansion is in the offing: Du Pont has high hopes for a large neoprene market in the paper field, where as an additive it provides high wet strength and chemical resistance. It is added to the beater during paper production and appears to give better resistance to aging and flex-cracking than other polymer additives. Large-scale tests have been made by a major producer of multiwall paper bags, and Du Pont is confident that after digestion of the present expansion, another increase will be in order.

ETHANOL FERMENTERS: They answer only the immediate problem.

ETHANOL BINGE

Long-term trend to synthetic alcohol continues despite rapid expansion of fermentation facilities for butadiene.

A BIG "hic" from the ethanol market this month in the form of reopening of ethanol-butadiene units affirmed that it was still on its long-time binge, dating back to the beginning of World War II. Gone for the moment were the signs of a return to "normalcy" that had been seen after the bottom dropped out of the market last year. However, the end of 1951 promises a small Bromo-Seltzer in the form of a new synthetic ethanol unit, to be completed by the Carbide and Carbon Chemicals Division of the Union Carbide and Carbon Corp. at that time.

Another sign of intemperance was that Tennessee Eastman Corp. has hired the Lummus Co. to construct an oil-absorption ethylene plant at Longview, Texas. As yet TEC isn't talking, but in view of the large quantities of synthetic ethanol that it purchases from the Esso-Standard Oil Co., synthetic ethanol is a logical bet.

Weakness for Butadiene

When the ethanol-based butadiene plants were placed in stand-by condition at the end of World War II, the hope was that they would never again be needed. But the course of events since the Korean War began has forced reactivation of the Kobuta, Pa., and Louisville, Ky., plants despite their high cost of operation—at least 200% higher than for petroleum-butadiene plants at current ethanol prices. The reason is not hard to find: Imports of natural rubber have not kept pace with the demand. For example, 37% of the Malayan rubber exported for the first six months of this year was destined for U. S. consumption, while in July this figure had dropped to 27%.

At the moment synthetic rubber is taking about 5 million gallons of ethanol each month and it is expected that this consumption will be increased to about 15 million gallons per month by the early part of 1951. Added to synthetic rubber requirements are large ethanol needs for smokeless powder production where a mixture of ether and ethanol softens the nitrocellulose before extrusion from the "macaroni" presses. Other rubber-bound chemicals coming from ethanol are Kopper Co.'s styrene produced from ethanol-based ethylene at Kobuta, Pa., and some of Dow's styrene is similarly produced. To meet these needs, either ethanol production will have to double or the difference must be supplied by imports.

Ethanol to feed the reactors at Kobuta and Louisville, either imported or made from grain, will cost at least 75¢ a gallon. This was the price posted by one producer some time before reopening of the ethanol-based butadiene units was announced. This high price was caused by a forced switch from blackstrap molasses to corn as the raw material. Where molasses-based ethanol is available, long-time customers are still paying 45¢ per gallon. Persistent reports indicate, however, that molasses suppliers have already taken up the slack for next year. Contracts are tied to the price of ethanol, and a floor of 13¢ per gallon under the price of molasses is provided. But even 13¢ will produce a 50¢-a-gallon price tag.

There are two reasons for the present shortage of molasses: a rapid increase in the use of blackstrap as a cattle food and large-scale purchases by the British. Until recently the British aliphatic chemical industry was primarily based on fermentation alcohol. But the recent installation of such large-scale synthetic ethanol units in England as Shell's $16-million petro-chemical plant at Stanlow might well reverse this flow, making more molasses available to fill the butadiene maw.

Back on Corn

Of greatest long-term significance is the probability that, except for war-induced variations, the ethanol price curve can be ironed out. Much molasses ordinarily earmarked for ethanol has gone into cattle food; and, if animal hubandrymen can be believed, this trend will continue unless ethanol producers are willing to meet their price. According to them, with corn selling for $1.50 per bushel, blackstrap can be assigned a value equivalent to ethanol at about 60 cents per gallon. Thus in a normal market, non-existent at the moment, corn is in the driver's seat.

The price of corn will control the price of molasses-based ethanol, and in view of the oft-repeated intention of the government to maintain the prices of farm products, blackstrap producers will lose little time and make more money by holding molasses prices at a level which is competitive with corn for feedstuffs—a level that appears to be appreciably above the selling price of synthetic ethanol, even when allowance is made for the present inflated construction costs.

Synthetic Ethanol—the Bromo-Seltzer

Current abnormal civilian and wartime needs aside, the question, "Why

not still more synthetic ethanol?" is thus still legitimate. The answer is compounded of economics, politics and memories of past performances. The economics has been discussed and the politics revolves around the ever-present possibility of a government subsidy for production of alcohol from grain.

The alcohol market's past history has been one of great ups and downs, with the introduction of the synthetic material in the early '30s the first major steadying influence. This, however, has had very little influence on the spot market price: Most of this material is used in vertical integration (as is the ethanol synthesized by Carbide and Carbon) or sold on long-term contract (as is that produced by the Esso-Standard Oil Co. and sold to Tennessee Eastman Corp.).

As late as 1948 alcohol prices nose-dived from a level of around a $1 per gallon to as low as 17¢. This dive was quite disconcerting to producers of synthetic ethanol, one of whom had just completed a new plant wherein ethylene is hydrated directly, rather than via ethyl sulfate as in all other synthetic ethanol plants. Price performance since 1948, however, has been much more reassuring, the spot price first oozing and then spurting upward to the current 75¢-a-gallon level.

Both the long- and short-term market positions seem to spell out the words: new facilities. However, with the exception of Carbide and Carbon, present and potential producers were reluctant to comment when asked if they planned to expand their ethanol capacity. The usual statement was, "We are studying the situation." Carbide and Carbon, largest synthetic ethanol producer, is the only one with definite plans at the moment; at least it is the only one to make public any definite forward move. Tennessee Eastman will make ethylene, but the answer to the question, "What for?" is tucked away in the files at Kingsport. In any event, synthetic ethanol soon can be expected to contribute more than the current 60% of the total normal ethanol output.

Immediate requirements will be met by fermentation of the most readily available carbohydrate material. One exception will be the long-promised production of ethanol as a by-product of the synthesis of gasoline by Carthage Hydrocol, Inc., at Brownsville, Texas. But this production, estimated to be about ten million gallons per year, will only palliate, not cure, the present need. Long-term requirements will be met by synthesis from ethylene.

ICEPHOBIA

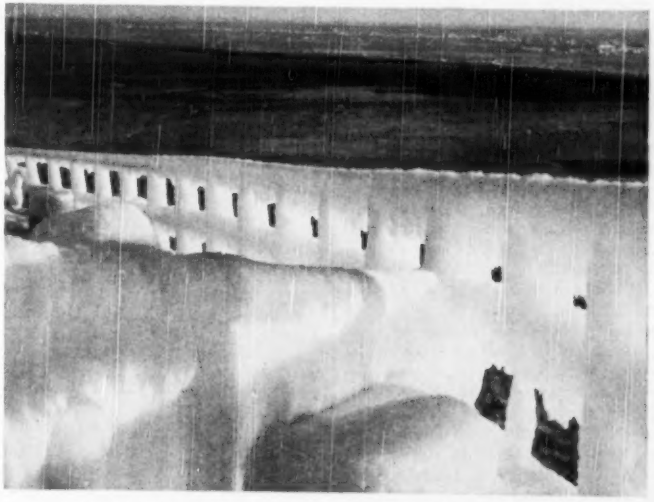
Armed services seek industry's aid to solve slippery problem of ice formation.

THEORETICALLY there are as many ways to attack ice formation as there are ways to skin a cat; and the armed services—plagued by cold, rough seas, slippery footing, and foot-thick ice coatings on guns—are deeply concerned with all of them. Urgently needed are coatings of one kind or another that prevent or lessen adhesion of ice to various kinds of surfaces. An engineer in the Navy Department's Bureau of Ships coined a word to succinctly describe such coatings: "icephobic."

Need for such materials isn't confined to military ships, guns and planes: In war or peace ice is a problem on railroad switch frogs, electrical conductor rails or trolley wires, signal mechanisms, refrigerator freezing units, valves and other equipment exposed to wintry weather, and—of course—commercial aircraft and marine vessels.

Progress Made

A great deal of progress has already been made. The Air Force has developed a successful de-icing system for parked aircraft that depends on a freezing point depressant (USAF Specification No. 3609). One of the earliest problems tackled by the Bureau of Ordnance resulted in the development of an icephobic cloth—glass cloth coated with vinyl resin—to replace the canvas covers used to protect open guns.



Currently a British firm, Kilfrost Manufacturing Co., Ltd., is distributing its fifteen different de-icing products in this country through Chipman Chemical Co., Inc., Bound Brook, N. J. The compounds are widely used in Great Britain (including the armed forces) and Scandinavia, and they are now being tested by the U. S. Department of Defense.

Industry Helps Out

Not content to leave any stone unturned, the Bureau of Ships has requested assistance from industry in the development of icephobic coatings. A task committee* has been set up, therefore, within the National Security Industrial Association (*CI, Nov. 1949, p. 707*), to seek materials for evaluation under this program.

The committee has pointed out several considerations that must apply: The coatings should withstand several re-icings and the effect of ocean spray for about 6 months if they are to be used on ships, but effectiveness for a few hours or a day or two is usually sufficient for aircraft. Coatings of various colors are needed for camouflage, but a clear coating which would not interfere with the color of the base coat or could be applied over glass or clear plastic windshields would also be desirable. Combinations of mechanical or heating systems with icephobic coatings must be considered, as well as how much ice must be removed or

* Mr. Patterson Humphrey, Secretary, Icephobic Paint Task Committee, National Security Industrial Association, 110 William St., New York 7, N. Y.

ICE-COATED SHIP DECK: A universal need, a multifaceted approach.

how much may be tolerated at any one time.

Ice Removal Systems

A durable coating to which ice will not adhere is, of course, the desired goal. At present such a coating does not exist. Known coatings giving the lowest consistent ice adhesion require fusion to the surface at high temperature. No equally effective material has been found which can be applied as paint.

The plastic material which has shown best icephobic properties is Kel-F, monochlorotrifluoroethylene. Silicone coatings also show some promise, but must be baked on. Teflon and polyethylene show varying ice adhesion characteristics, under some conditions so low that they must not be overlooked as possible useful materials. Ice adhesion to polystyrene and polystyrene-based lacquers is only about 5% to 10% of that on steel or painted surfaces. In general, hydrophobic materials are also icephobic, but there are exceptions to this rule.

Besides mechanical and thermal systems, other systems which may facilitate ice removal are freezing point depressants, parting compounds, adhesion depressants, and nucleated surfaces.

Systems which use freezing point depressants are water-soluble, and their success depends upon a continuous supply unless action is only needed for a relatively short time. As alcohol and the lower glycols make the best compounds, there frequently is the consideration of fire hazard.

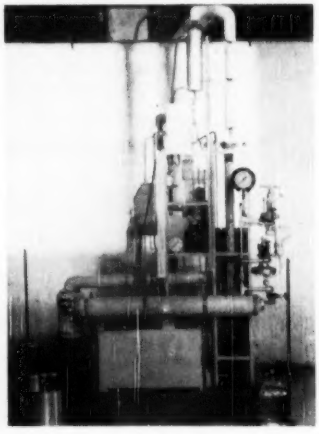
Parting compounds include water-soluble greases, such as silicone grease, vaseline, and oil. As they are removed with the ice, they are effective only for a short time.

Adhesion depressants are systems which include water-soluble elements in concentrations far below that required for depression of freezing point. Such coatings are effective in reducing ice adhesion and are less vulnerable to rain or water erosion. Antice, reported to be a product of this type, is manufactured by the Schenectady Product Development Co.

Under proper conditions air may be seeded with countless ice crystals by utilizing the sudden cooling of compressed gas as it escapes through a nozzle, essentially drying the air. Ice forming on a surface under these conditions develops a very porous structure and unusually low adhesion. An air nucleation method, in combination with some mechanical system, might be used for protection of radar equipment in certain locations. There are chemical nucleating agents that lead to the same type of ice formation on surfaces and that will work at temperatures well below the freezing point of water. However, none has yet been found which is effective right up to the freezing point.

Many Avenues

There are thus many avenues to the ultimate goal. Some one of them—or a completely different one—may eventually prove to be the easiest and best; but it may take a lot of military-sponsored research and industry cooperation to discover it.



DOUBLE DISTILLATION

Improved methods of processing expand frozen juice concentrate field.

A DEPARTMENT of Agriculture research team at the Eastern Regional Research Laboratory, Philadelphia, has developed a process to make frozen apple juice and Concord grape juice concentrates which, when reconstituted by the addition of water, taste like the natural product.

In making orange juice concentrate the juice is evaporated to a sixth of its volume and then thinned with fresh orange juice to a fourth of its volume. This method does not work well with most other juices, for they lack full flavor and aroma. The Eastern Regional Research Laboratory's scientists discovered that the missing flavor could be recovered by capturing the volatile flavor constituents lost during the evaporation process.

Already installed by over fifty fruit processors is equipment based on the Laboratory's patents for recovering the flavor essence of Apple juice. Among the larger of these are the Empire Fruit Products Co., New York, and the Apple Growers' Association of Hood River, Ore. One of the installations is designed to process 5 million gallons of juice a season.

ERRL'S PILOT PLANT: Odor was the hint.

In this method, 100 gallons of apple juice are rapidly evaporated at atmospheric pressure until about 10 gallons, containing practically all the volatile flavor, have been vaporized. The remaining "stripped" juice is further evaporated under vacuum to produce about 15 gallons of concentrate, while the vapors from the atmospheric evaporation are fractionated to yield one gallon of essence and nine gallons of practically pure water. The essence and concentrate are then mixed to form a "full-flavor concentrate."

Pressing Problem

Because of the size of the industry and the value of its products, juice pressed from Concord grapes was the next selected for study. It was soon found that grape essence recovered from the vapors of even as much as 48% of the grape juice did not have sufficient aroma and potency to give a full-flavor concentrate.

First hint to the solution of this problem was the characteristic grape odor of the distillate from the vacuum evaporation of the stripped juice, and efforts were directed toward recovering a second essence from this distillate.

It was found that rapid (to avoid decomposition) atmospheric evaporation of 20-25% of the original pasteurized juice removes essentially all volatile flavors. For this operation, evaporation is accomplished in a single pass evaporator using 15 psi steam pressure. The evaporator and all other equipment used in this process are made of stainless steel. Total time for heating, vaporizing, and cooling back to room temperature is 20-30 seconds. The vapors pass to the bottom of a fractionating column and are concentrated to produce one gallon of essence for every 100 gallons of juice.

Depectinization

A pectinase enzyme is added to the stripped juice so that the concentrate will not become too thick. After standing overnight, the stripped juice is heated to 140° F. to destroy any excess pectinase and immediately filtered. Evaporation occurs in a calandria-type evaporator operating at a vacuum of 27.5-28.0 inches of mercury and a temperature of 99-109° F. The juice is evaporated to a density of 50° Brix

for use in the frozen concentrate. Further concentration to 65-70° Brix provides a sirup which is self-preserving against fermentation and with added essence finds use in enhancing the flavor of grape jellies and preserves.

Second Essence

The distillate from the surface condenser is fed to the essence equipment and processed much like the fresh juice. Twenty to twenty-five percent is evaporated and the vapors are fed into the fractionating column to give a 100-fold second essence. This is equivalent to 0.6 gallons of the original juice. The final full-flavored concentrate made from 100 gallons of juice is 16.25 gallons of straight concentrate, one gallon of first essence, and 0.6 gallons of second essence. This 17.85 gallons of full-flavored cancentrate, plus 82.5 gallons of water, yields 100 gallons of full-flavored juice so similar in taste to natural grape juice that trained tasters can hardly discern the difference.

Private enterprise has not been sitting on its hands, of course, while the Government reasearchers have been busy working out their process. Among others, Mojonnier Bros., Chicago, has developed and sold an independent process. Among them all, it looks as if a lot of apples and grapes will give up their moisture.

HLB PROGRESS

Atlas Powder Co. simplifies system of emulsifier selection.

ATLAS chemists have been seeing what more they can do since the company introduced the "HLB" method of emulsifier selection a couple of years ago (*CI, Nov. 1948, p. 764*).

HLB means hydrophile-lipophile balance, and it is a quantitative measure of how much a surface-active agent loves water and hates oil, or vice versa. A low HLB value indicates that the agent is attracted to (and is usually soluble in) oil, while a high value indicates similar behavior towards water.

The wide choice of emulsifiers and mixtures thereof is narrowed down, then, to those whose HLB values match the HLB requirement of the job at hand.

Narrowing Further

What Atlas has done in the past two years is to refine the calculations of HLB requirements. Formerly values were available for general uses and several specific formulas; but now Atlas has calculated specific HLB requirements for a large number of common emulsion ingredients—lanolin, stearic acid, various oils, petrolatum, various waxes, cetyl alcohol, etc. A proposed cosmetic cream, for example, may have the following composition:

EMULSION FORMULATION: A lightened burden.

Beeswax	5%
Mineral oil	26%
Hydrog. vegetable oil	18%
Polyol	4%
Emulsifier	5-10%
Water—q. s. to make	100%

The components of the oil phase—beeswax, mineral oil, and hydrogenated vegetable oil—have required HLB's of 5, 10 and 9, respectively. The total oil phase makes up 49% of the total. The calculation is simple:

Component	*Proportion*		*Req. HLB*
Beeswax	5/49	x	15 = 1.5
Mineral oil	26/49	x	10 = 5.3
Hydrog. veg. oil	18/49	x	9 = 3.3
Estimated required HLB			10.1

It will be found, then, that emulsifier combinations having an HLB of about 10 will work best in such a cream.

Still Cut and Try

That's not saying that any emulsifier of HLB 10 will do the job. HLB is only one factor; chemical constitution of the emulsifier makes a lot of difference in the final result. The calculated HLB will give the best results from any one chemical type, but optimum results require both the proper HLB and the correct chemical type.

Nevertheless, the formulator's burden will be considerably lightened if he only has to try out six emulsifiers instead of sixty.

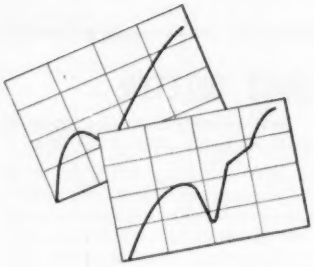
DUST DELETER

New asbestos-containing paper is basis for highly efficient air filter.

A NEW air filter which utilizes a special paper containing finely divided asbestos fibers has emerged from the postwar search for an inexpensive material capable of removing minute particles of radioactive material from air. The new filter paper, developed by Arthur D. Little, Inc., for the Atomic Energy Commission and made by Hollingsworth Vose Co., will remove all but 0.02% of the dust normally present in country air.

High Capacity

The soft felt-like paper, 0.04-0.05 inches thick, can be pleated to achieve a very high capacity per unit of filter volume. A single filtering unit consists of deeply pleated sheets of the paper held in a wooden frame by a plastic adhesive. The pleats are spaced by ordinary box-board corrugated paper, thus permitting easy passage of the air to be filtered, which enters the end of the honeycomb-like assembly. Sponge rubber gaskets cemented around the edges of the frames prevent airleaks when the frame is clamped into place.



The present filter unit, 2′ x 2′ on the face and 1′ deep, is capable of cleaning 800 cfm of air with a pressure drop of only 1 inch of water. The linear velocity through the filter box is approximately 250 ft. per min. but the extended surface introduced by the pleats in the paper reduces this to approximately 5 ft. per min. through the paper itself.

Clean Air for Industry

The 800 cfm units, now used by AEC, are expected to be available to industry in the very near future. It is hoped that this capacity will be extended up to 2,000 cfm shortly thereafter.

A life of six months can be expected when operating on ordinary country air before the pressure drop increase necessitates disposal of the paper. The higher dust content of the atmosphere in industrial areas necessitates use of precleaners, such as fiber or electrostatic filters, ahead of the new filter unit if clogging is to be held to a reasonable level. With precleaners a life of two years can be expected.

Major application will probably be the cleanup of air coming into plants making photographic film, fine instruments, pharmaceuticals, etc., where absolute air cleanliness is essential.

Figures on the Future

EDITORIAL STAFF REPORT

THE FUTURE IS SCANNED in two interesting reports. Growth in the process industries will help boost living standard by one-third.

PREDICTING the future is a game to some but a job to many. In the last few months two organizations who view it as a job compiled reports on what the chest and bicep measurements of a still growing industrial America will be in 1955 and 1960.

The report that squinted ahead five years was assembled by the research department of J. Walter Thompson, the well known advertising agency. It directed its focus mainly on the consumer-marketing situation that may prevail five years hence. The other report was the product of McGraw-Hill's Economics Department. It devoted the major part of its prospecting to the industrial-production scene that may be expected at the end of this decade.

Both make interesting reading. And the passages of the McGraw-Hill tome on the chemical process industries are especially significant to the men who shape the destiny of that enterprise. Unfortunately, these industrial predictions were put together before the 38th parallel sprang its violent leak. As a result, they do not take into account the effect that stepped-up military procurement will have on national industry. Even so, the report is still useful as a depiction of the normal growth trends that strain on behind the distortion of crisis-ridden figures.

PROCESS INDUSTRIES KEEP GROWING

The chemical process industries will continue their much heralded growth throughout the next ten years. There is no sign of leveling off in the future. New products and new uses for established products keep prodding the growth curve ever upward. The main push in this direction is being contributed, not by the old line heavy chemicals but by the synthetics that have a way of replacing costly fibers, metals and other natural materials.

In this era of high labor costs, investment in the chemical process industries is especially tempting. A twist of a valve handle by the hands of one chemical plant worker releases a flow of productive effort equivalent to many pairs of hands in other fields.

The synthetic fibers, rayon and nylon, are growing at a rate that may double their markets by 1960. And newcoming synthetic fibers such as orlon and dynel may press wool hard. At present chemical processes are furnishing about 20% of fiber requirements. But by 1960 this figure is likely to be doubled.

New applications continue to stimulate the demand for plastics. Production of these materials this year will round out to about 1.9 billion pounds. But the report claims that a decade hence the figure will be 3 billion pounds.

The production of fuels will undoubtedly remain the main stock in trade of the petroleum industry for some time to come. But the making of chemicals from petroleum, an enterprise still in its adolescent stage, may become man-sized by 1960. At present 25% of all synthetic chemicals are made from petroleum. By 1960 this figure bids well to become 40%.

But the growth of petrochemical output will not be at the sacrifice of regular line refinery products. Gasoline, greases and lube oils must be produced in increasing amounts to meet the demand of our transportation-based economy. High compression engines mean higher octane gasoline and each year brings more Diesel engines and a demand for more Diesel fuel. As a result the swing will be to light fuels for transportation and somewhat away from the heavier fuels used for heating.

But perhaps the most striking growth in fuels will be that of natural gas for home heating and industrial uses. The sale of natural gas for these purposes in 1952 will represent a 20% increase over 1949.

In the last decade the quantity production of pharmaceuticals has definitely become a chemical process industry. Advances in biochemistry and the increased breadth of government and industrial medical programs have been mainly responsible for this new shape of an old industry. Similarly the impact of technology on agriculture will continue to make the farm a major consumer of heavy and light chemicals such as fertilizers and insecticides.

HIGHER STANDARD OF LIVING

The Thompson report with the observation that the high employment, purchasing power and consumption levels reached in 1950 were not just the result of the replenishment of inventories after the "unnecessary" inventory scare of 1949. They were really the first evidence that this country had begun to feel the upward surge in standard of living that had been latent since World War II. It proved that our productive ability is far in excess of the prewar concepts of living standards and civilian consumption.

To capitalize upon this situation it is necessary that Americans learn to live a third better than at present within the next five years. There is reason to believe that at the end of this period America could support a peacetime production of over $330 billion.

In order to match this productive ability the total consumer market for goods and services would have to expand by 1955 to over $235 billion or one-third greater than that of 1949. In the same time the demand for nondurable goods would have to expand from $98.9 billion in 1949 to $120 billion. Services and housing would also have to increase from $51.1 billion to $85 billion in 1955.

The remainder of the Thompson report shows that these demand growths are not beyond reason to expect. They are completely in line with predicted population increases and the present high levels of individual savings, low levels of consumer debt and the increasing urbanization of the population.

A CI REPORT ON

WAXES

Types, Production, Properties, Uses

by CHARLES J. MARSEL*

A manufacturer can intelligently select a wax-like material for his product or process if he knows the different sources, means of production, properties, applications and price range of commercially available waxes. The author reviews current wax technology, appends a handy reference list of waxes on the market.

WAX-LIKE MATERIALS are among the oldest and the newest of the raw materials and products of the chemical processing industries. Use of wax derived from animal and vegetable sources as protective coatings goes back thousands of years; new materials for this and other purposes are coming out of chemical laboratories daily.

Application of modern engineering techniques has made the unique properties of the time-honored materials even more valuable than they have been in the past. The petroleum industry, which can supply almost limitless amounts of wax, has improved its refining procedures so that specialty waxes for a variety of uses are now common materials of industry. And chemical manufacturers themselves have developed synthetic materials that have desirable wax-like characteristics.

Such industrial activity has resulted in a tremendous growth in the variety of available waxes as well as in the number of their uses. Wax has now attained an impressive industrial position not only as a protective coating and polish, but as an important constituent of carbon paper, cosmetics, pharmaceutical preparations, stencils and inks, adhesives, lubricants, photographic preparations, flameproofing compounds, electrical insulation, paints, chewing gum, paper and textile aids, and many others. An examination of the sources, properties and uses of wax-like materials should be of value to all who use waxes in their processes, or whose products have properties that make them likely wax substitutes.

In this review of modern wax technology, all wax-like substances will be included regardless of their source, since waxes are used industrially because of their peculiar physical characteristics and seldom because of their chemical nature. The major classes of waxes include:

- Natural waxes—plant, animal and insect.
- Petroleum waxes—paraffin and microcrystalline, including petrolatum and oxidized microcrystalline.
- Mineral waxes—ozokerite, montan and ceresine.
- Synthetic waxes—a wide variety of chemical compounds.
- Wax blends—blends of any of the above.

PLANT WAXES

Plant waxes occur mainly as coatings on plant leaves and stems and on certain berries and grasses, with some of the rarer waxes appearing on flowers, roots and fruit. Most of the trees and plants from which these waxes are obtained grow wild in different sections of the world. The plants which produce the greatest amount of wax for their weight are found in hot or tropical climates, particularly in arid regions; here the wax acts as a coating to impede moisture evaporation. In the arid plants, glycerides apparently are transformed into high molecular weight acids, alcohols, and hydrocarbons; these can further react to give esters, lactones, resins, etc.

CARNAUBA WAX

Carnauba wax is obtained from the leaves of the carnauba palm, which grows wild in various parts of the world, but only produces wax in the three or four states in the semi-arid northeastern part of Brazil. Its high melting point, hardness, ability to take a high and lasting polish, and compatibility in mixtures make carnauba the most important wax in the plant group.

The carnauba palm grows mostly along the banks of rivers and lakes, and has leaves which grow from long stems in a fan shape. The wax forms a continuous film over the surface of the leaves to conserve moisture during the dry season. This is the season when the wax is harvested by native workers, who cut the leaves with long sickle-like knives. After the large leaves are cut, they are carefully transported to a central terrace for field drying, although at least one large United States company producing carnauba wax in Brazil dries its leaves indoors.

The leaves are first shredded by

* Dr. Marsel, associate professor of chemical engineering, New York University, University Heights, N. Y., is a consultant specializing in waxes.

HOT LIQUID WAX being run into mold. An extra portion is released into mold to allow for shrinkage.

drawing them across a series of tooth-like blades which split the wax-containing ribs apart and open the leaf webs. They are then beaten against sawhorses to remove the wax dust. Brazilian law requires that this operation be done in a building with tight walls, ceilings and floor to avoid loss of the powdery wax. The wax dust is then melted down and strained. After the wax solidifies, it is broken into lumps and shipped to the coast for export and refining.

There are a number of grades of carnauba wax available commercially. If the wax is obtained from the *olho* leaf, the young new leaf that grows upward from the center of the palm, it is very light in color, and quite pure. The majority of wax, however, is produced from the *palha* or older horizontal leaves; this wax ranges in color from greenish-yellow to a dark brown.

Common grades of carnauba wax are: #1 Yellow; #2 Yellow; Fatty Grey; North Country #2; Cauhype; North Country #3; Chalky. Chalky wax has had 5-10% moisture added during the crude refining operation.

The color of the wax depends on the age of the leaf; older leaves yield a darker wax. Certain physical and chemical properties can also be correlated with leaf age.[1] Older waxes have higher acid numbers, lower iodine numbers and lower flash points than younger waxes. This would appear to be evidence of increased oxidation and degredation of the molecule upon longer exposure to air and sunlight. Recently an intensive study of the variations in physical and chemical properties found in these various grades was sponsored at New York University by the American Wax Importers and Refiners Association, Inc.[2]

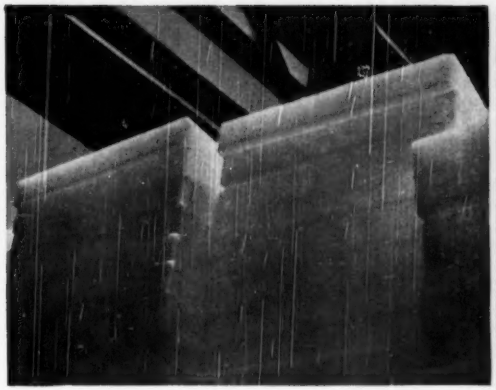
A carnauba palm, of which there are 50 to 75 million producing, should be about 10 years old to yield an appreciable quantity of wax. Since average yield per leaf is about five grams and there are usually less than twenty leaves cut from a tree yearly, it takes about five trees to produce a pound of wax per year. The processing involved accounts for the relatively high cost of carnauba wax. In 1944 the OPA ceiling price was established at 80¢/lb.; current price of North Country #3 refined is 84-86¢/lb. The United States customarily imports 75% or more of the Brazilian production. U. S. imports run about 18 million pounds a year.[3]

The two main uses for carnauba wax are in water emulsion floor polishes and carbon paper. Shoe, automobile and other polishes also use considerable quantities. A miscellany of other manufacturing uses include phonograph records, insulating materials, electric batteries, candles, matches, soaps, salves and chalk. Carnauba is often used in a mixture of waxes as a melting point booster.

About 75% of carnauba wax is the ester myricyl cerotate. Despite much work, there is no completely successful substitute for carnauba, as the ester itself cannot be synthesized economically, and other suggested compounds lack the unique combination of necessary properties.

OURICURI WAX

A wax somewhat similar to carnauba but cheaper in price is ouricuri. This wax is obtained from the undersurface of the leaves of a low feathery palm, growth of which covers 60 million acres in the State of Bahia; it is estimated that there are about 250 trees to the acre. The tree grows wild and for many years the only commercial interest was in the edible oil derived from the kernel of the nut which the tree produces. During the middle 1930's, however, it was discovered that the wax had characteristics similar to carnauba, and production has steadily increased.



The wax is scraped from the leaf by knife, melted and strained. Its high gravity does not permit ready separation by settling of plant impurities, and the gathering and extracting industry is not as well organized as for carnauba. Hence commercial ouricuri contains many more impurities than carnauba.

Ouricuri is used often as a substitute for carnauba but due to its higher resin content it is not always a desirable replacement. Its uses are similar to those for carnauba. OPA price for ouricuri was 48-62¢/lb.; current price of the refined material is 84-85¢/lb. U. S. imports have run about 3.5 million pounds a year.[4]

PALM WAX

Several other waxes similar to ouricuri but of lesser commercial importance are available. One of the most interesting, but as yet practically unknown waxes, is the palm wax of the Colombian Andes known as Ceroxylon wax because it is obtained from the tree called *Ceroxylon andicolum*. There is, apparently, more than one variety of this tree. Some are said to grow 200 feet high, while others average 40-50 feet. The wax coats the outside of the palm trunk as a glistening white covering. It is scraped from the leafy palm as a hard flaky white material.

Palm wax has received a bad name because it has been offered when largely adulterated with paraffin; in fact, wax blends used as carnauba substitutes are often referred to as palm wax. Of late years, however, two types of palm wax have been imported into the U. S. One is a crude

CAKES of refined wax awaiting packaging and shipping. Paraffins and microcrystallines are the principal petroleum waxes.

LACING BAGS that have been packed with refined wax. A wide range of grades of petroleum waxes, many with special uses, is made.

wax arriving in lumps, with a melting point of 72° C., and the other is the palm powder itself which, when refined, yields a wax with the phenomenally high melting point of 112° C.

These waxes are very resinous, showing a high melting point with a much lower solidifying point, and possessing a high iodine value. Strangely enough, except for melting point, both of the types mentioned appear to be similar in chemical characteristics. The wax dust is extremely hard to refine, as it contains about 10% of fibrous material, must be melted in special vessels before refining, and to obtain a good yield, requires that the fibrous residues be extracted by solvent extraction. This high-melting wax is one of the hardest, if not the hardest, of the natural waxes. It would seem that this true palm wax should be outstanding for some special purpose if more interest were taken in it.

Another wax in the palm group, raffia wax, is obtained from the Madagascar sago palm.

CANDELILLA WAX

When considering waxes obtained from the stems, fruit or leaves of small plants, the most important wax is candelilla. Its source is a rush-like perennial weed found in the dry regions of Northern Mexico and Southern Texas. Most of the production comes from Mexico. The candelilla plant consists of numerous slender cylindrical stalks which range in height from 2 to 5 feet. These stalks are covered with a powdery wax which gives the plant a bluish-green color.

These plants are pulled up by hand or cut off at the ground and transported by wagon or burro to the extraction plant. They are then placed in tanks and boiled with water acidulated with sulfuric acid. The plants are kept below the surface of the solution, and as the molten wax rises, it is transferred to lead-lined tanks. Here it is kept at the boiling point to remove water, and allowed to settle to remove dirt. The yield of clarified wax is about 1.5-3% of the air-dried plant. It is possible to obtain the wax by solvent extraction of the plant, but the economics of this process are questionable.

Candelilla is a hard and brittle wax. It is composed of about 50% hydrocarbons with smaller amounts of esters and free acids. Its principal use is in the manufacture of carbon paper, floor, furniture and automobile polishes, and packaged shoe stains and polishes; but it is also used in chewing gum, leather dressing, candles, cements, varnishes, sealing wax, electrical insulating compositions, phonograph records, paper size, celluloid, water-proofing and insect-proofing containers and paint remover, and as a blending agent in wax mixtures. It was price controlled at 38¢/lb. by the OPA; current price of the refined is 64-66¢/lb. U. S. imports have run as high as 9.6 million pounds a year[4].

SUGAR CANE WAX

A wax of considerable potential importance is sugar cane wax. The potential yearly production of hard wax from the sugar mills of Cuba alone would be about 60 million lbs., more than the world's combined production of carnauba, ouricuri and candelilla. The cane wax of commerce is a by-product of sugar production, and this fact, together with the magnitude and permanence of the sugar cane operations, should provide unique advantages for the future of cane wax production in terms of quantity, permanence of supply and cost considerations.[5]

The wax occurs as a thin white layer on the exterior of the stem of the sugar cane. When the cane is being milled, about 40% of the wax is loosened and it stays in the juice as part of the suspended matter. The remainder of the wax remains on the bagasse; the tremendous bulk of the bagasse and the low wax concentration (0.1%) make its recovery impractical. The wax in the juice is concentrated in the press cake of the final raw juice filtration, along with the cane oil and other fatty and resinous constituents from the inner cells of the cane. Isolation of the wax from this mud or cachaya has been described by E. S. McCloud of S. C. Johnson & Son, Inc.[5]

The total solvent extractable mixture of wax, fatty, and resinous material is present in the amount of 21% of the dry press cake. This crude wax mixture is leached from the filter cake mud in a continuous vertical extractor. It is implied that the crude wax so obtained is extracted with acetone at 90-100° C., and a resin fraction consisting mostly of the calcium and magnesium salts of wax and resin acids, in the amount of about 18% of the crude wax, remains undissolved in hot acetone and is separated. Upon cooling to room temperature the desirable wax fraction crystallizes out, leaving about 33% of the crude dissolved in the solvent in the form of a fatty oil. This wax, now freed of resins and oil, is a hard, sharply melting solid with a melting point range of 76-79° C., and color ranging from strong green to brown and tan.

Purified cane wax contains approximately 66% esters, 27% free acids, 5% free alcohols and 2% hydrocarbons. Chemically speaking, the wax is more complex than the other hard waxes of commerce. It is stated that the characteristics of the final product may be varied depending on the ini-

tial recovery process and the final refining or treatment operation.

In 1916 and for about a period of ten years thereafter a sugar cane wax recovery plant in Natal, Union of South Africa, produced and shipped several thousand tons of sugar cane wax. The plant was closed, and it is believed the decreased demand was due to non-uniformity of lots because of relatively crude recovery methods.

Apparently a series of products will be marketed, based on the types demonstrated to have the greatest value in specific uses. Uses claimed for the wax are similar to those for carnauba.

Present production is from a Gramarcy, La., plant owned jointly by S. C. Johnson & Son, Inc., and the Cuban-American Sugar Co. Warwick Wax Co., Sun Chemical Corp. subsidiary, is the sales agency for the wax, which is selling at about 70¢/lb. in carloads. Potential uses for the wax are in water-emulsion polishes, carbon paper and paste polishes; as pigment dispersers and for casting purposes. Uses are also being sought for the resin and oil fractions obtained as by-products from the solvent extraction.

JAPAN WAX

Japan wax resembles a fat rather than a wax; it is obtained from the berries of a small cultivated sumac-like tree which grows in Japan and China. The wax, occurring between the outer skin and the kernel of the berry, is obtained by a steam rendering process. A tree produces over a span of about 100 years and has an annual yield of about 30-45 lbs. of berries containing about 15% crude wax. The wax melts at about 50° C. and is used in candles, rubber vulcanization, polishes, and textile finishes. Current price is 62-65¢/lb.

ESPARTO WAX

Esparto wax is derived from esparto grass, a tough grass found principally in Northern Africa. Consumption is mainly in Britain. The grass is dewaxed and used in making fine grade paper.

FIR BARK WAX

Another new wax is obtained from the bark of Douglas fir tree. This development is an outgrowth of work on the saccharification of Douglas fir waste wood to produce ethanol. The Oregon Wood Chemical Co., Springfield, Ore., plans production of three tons per day of the wax by steam distilling benzene which has been used to dissolve wax from the ground bark.

There are many other plant waxes found naturally in varying amounts, but they are of small commercial importance.

ANIMAL AND INSECT WAXES

BEESWAX

In this group beeswax, use of which has been traced back to the early Egyptians, is the most important commercially. *Apis mellifica*, the domesticated honey bee, furnishes most of the beeswax of commerce. Wax scales are secreted by eight wax glands on the under side of the abdomen of the worker bee as a digestive secretion formed in the stomach from the honey and flower pollen. The scale is removed from the abdomen and received by the mandible of a co-worker where it is chewed before being placed in the cell of a comb. Bees are believed to secrete 1 lb. of wax for every 8 lbs. of honey they produce. Crude beeswax varies in color and quality with the type of bee, its food, and the processing of the wax. Crude beeswax is usually rendered from the frames and scrapings by melting in boiling water often containing a small amount of H_2SO_4. It is then strained and solidified. The wax is then usually bleached, often by sunlight, yielding a white or light yellow product. Domestic beeswax does not bleach as readily as does much of the imported wax; consequently the domestic price is lower. Current price of the crude imported material is 56-62¢/lb., depending on the source.

Principal constituent of beeswax is myricyl palmitate, although it contains substantial quantities of free wax acids and hydrocarbons.[6] Beeswax is used in many industries and its production and distribution is world wide; world production has been estimated at over 40 million pounds annually.[7] U. S. imports have been 6-7 million pounds a year; consumption has run close to 12 million pounds.[7]

Because of its relative cheapness and plasticity, main use of beeswax is in cosmetic preparations. Next largest use is in church candles, for beeswax candles give off a perfumed odor on burning. Candles used for Mass and Benediction in Roman Catholic churches must contain at least 51% beeswax; many contain a higher percent. Other uses include polishes, modeling, and pattern making.

SPERMACETI WAX

Spermaceti wax is obtained from the head of sperm whales, where it is dissolved in the sperm oil. The oil, drained from the huge head cavities, is allowed to stand, and the wax crystallizes out. The wax has a melting point of 43° C. and becomes rancid on aging. The standard candle for measuring light intensity uses spermaceti because of the bright flame produced on burning. The wax is essentially cetyl palmitate. It is used for candles, in medicine, and as a source of cetyl alcohol. Current price of the wax in blocks is 28-31¢/lb.

CHINESE INSECT WAX

This wax is deposited on the leaves and stems of certain types of ash and privet trees in China by an insect called *Coccus ceriferus*. The insect does not breed in the same district as the trees, and the eggs are transported yearly about 200 miles and suspended on the shoots of the trees. The branches of the tree, which are covered with a thick deposit from the insect, are placed in boiling water to release the wax. It takes about 1500 insects to produce 1-2 grams of wax. The wax is used in candles, furniture polishes, and coatings for paper and cloth.

SHELLAC WAX

Shellac wax is obtained as a by-product in the preparation of spirit shellac. The shellac is deposited in a fashion similar to the Chinese wax by the lac insect. The shellac is dewaxed by a solvent treatment, and the wax used as a component of insulating material.

WOOL FAT

Since the purified fat of the wool of the sheep consists mainly of the fatty acid esters of cholesterol and other fatty alcohols,[6] it may be considered chemically as a wax, although its properties cause it to be considered commercially as a fat. It is obtained as a by-product of wool purification, and has many uses.

PETROLEUM WAXES

Petroleum waxes are the solid waxes obtained from various petroleum fractions. Although their outstanding property is resistance to water vapor, these waxes vary considerably in properties depending on the processing involved in their manufacture, and the fraction of the particular crude from which they originated. Improved refining techniques have resulted in a wide range of grades, with many specialized uses. These variations in properties that are available for different applications plus their adequate supply at low and stable prices make petroleum waxes particularly attractive raw materials.[8]

Crystalline type waxes consist principally of saturated straight-chain hydrocarbons ranging from C_{17} to about C_{60}, and minute amounts of unsaturates. The latter, which apparently become dark upon oxidation and/or polymerization, seem to explain the gradual discoloration of water-white wax when exposed to air.

The two principal types of petroleum waxes are paraffin waxes and microcrystalline waxes. There are many variations of each type, as explained above. Melting point of paraffin waxes is generally lower than micro waxes. Microcrystalline waxes are distinguished also by their small indistinct crystals compared to the larger paraffin crystals, and by their inherent toughness and outstanding tensile strength and flexibility characteristics. Microcrystalline waxes generally have more oil than paraffin waxes, which oil is held with exceptional retentivity, and therefore in some cases they have considerable tackiness. The crystals in paraffin wax are of the plate and needle type, while in micro waxes they tend toward malcrystallization or ill-formed crystals. Paraffin waxes have a greasy feel, compared to the tacky or resinous feel of micros.

PARAFFIN WAXES

Although decreasing in importance, the old pressing and sweating process for the production of paraffin waxes from wax distillate is still in use. This involves crystallization of the wax by chilling the oil, and removing the slack wax by filtering the slurry in plate and frame filters. Chilling the wax distillate is usually accomplished by heat exchange with the cold dewaxed oil, followed by further cooling by direct expansion of ammonia. When the wax slurry passes through the plate and frame filters, solidified wax is retained on the canvas cloth filters and the wax cake removed by hand scrapers. The de-waxed oil flowing beneath the press is processed into lubricating oils. An alternate method of removing the wax is by centrifuging it from the chilled wax slurry by means of Sharples supercentrifuges.

The operation of sweating consists of cooling the slack wax to a congealed mass and slowly heating it to temperatures of 100-140° F. in long shallow pans. If the wax is of the proper type and condition, it gathers into well-defined needle crystals and the oil drips or sweats from the wax cake.

Pressing and centrifuging, however, are relatively expensive operations. Many plants are now changing to solvent dewaxing units.[9] There are a number of solvents which can be used. One system used commercially is propane de-waxing, which is usually combined with de-asphalting because an improvement in color can be attained at little extra cost.[10] Evaporation of the propane itself, accomplished by reducing the pressure in the system, furnishes refrigeration. Filtering is done by rotary filters, where suction is maintained inside the drum while it dips below the level of the wax-solution slurry in the filter case. Washing the cake with propane is accomplished in the same cycle. The wax still contains from 6-8% oil and may be converted to "scale" wax by sweating, or by repulping the cake with propane and refiltering.

Another solvent process of increasing importance is one using a ketone solution, usually methyl ethyl ketone (MEK). Benzene and toluene, which are very good solvents for oils, are added to MEK, which has very low solvent power for wax. A typical mixture for low-viscosity oils is 55% MEK, 35% benzene and 10% toluene; this mixture has good solvent properties for oil and poor ones for wax. Wax distillate is diluted with the solvent mixture and chilled to precipitate the wax. The slurry is filtered in rotary filters. The cold filtrate, after heat exchange with the incoming feed, is stripped of solvents and further processed. The slack wax after washing is stripped of solvent and may be sweated or, alternately, solvent deoiled. This involves a redissolving in solution, re-precipitation and refiltering. A wax of very low oil content may be so obtained. Final operations on the wax may include acid treatment and clay contacting.

It is obvious that by proper adjustment of solvents, process variables and feedstock, specialized waxes of varying physical properties may be obtained.

Most paraffin waxes melt in the range of 40-60° C. They have many uses, of which the largest are coating paper and paper products, and making candles.

MICROCRYSTALLINE WAXES

Source for microcrystalline waxes is "pipe still bottoms," the heavy fraction remaining after distillation of the crude. Asphaltic materials are removed from the fraction by precipitation from liquid propane (propane deasphalting). Napthenic materials are removed by solvent extraction, often with phenol. Oil held in the malformed crystals of micro slack wax cannot be sweated, and a solvent process must be used. A typical operation would be the use of MEK solution in a sequence of operations similar to that described for paraffin wax.

The micro waxes can be classified into two types: the first is extremely ductile, flexible and tacky and is commonly used as a laminate; the second is a relatively high-melting dry or relatively oil-free wax of most interest in the liquid polish industry. This latter type has found wide usage in many fields, since in some cases the price picture is comparable to paraffin.[11]

Wax obtained from heavy residue stocks and containing enough oil to make them quite plastic are called petrolatums. Their use is largely limited to cosmetic and pharmaceutical applications. However, they are occasionally used as plasticizers in wax formulations.

EARTH WAXES

MONTAN WAX

Montan wax is a bituminous wax, not a paraffin, which occurs in woody coals or lignites, and is leached therefrom by solvent extraction. The crude wax is brown or black in color, but in the refined state it is light yellow or nearly white. The principal source is Germany, where its production is an old industry. In 1939, more than 7 million lbs. were imported here from Germany. The I. G. Farben Co., by suitable chemical modification of the montan waxes, produced a new series called I. G. waxes,[12] which were widely known and used in place of vegetable waxes.

Crude montan wax is produced in Germany from brown coal whose wax content runs 10-18%. The coal is granulated and dried by steam heat to a moisture content of 10-12%. The wax is then extracted from the coal with a solvent mixture of 85% benzene and 15% crude wood alcohol at 90-100° C. After extraction the solvent is distilled off, leaving the crude montan wax as residue. Extraction may either be a batch process or a continuous percolation process. The crude wax contains about 20% natural resins, and for certain purposes may be deresinified. This is done by powdering the wax and extracting the resin with hot alcohol. The deresinified wax may be further purified by bleaching.

The Bureau of Mines has investigated production of montan wax from domestic lignitic coals, and reported that certain lignites from Arkansas and California coals gave yields similar to the German coals, but the wax had a higher resin content. A similar solvent extraction was used.[13] During World War II the American Dyewood Co. operated a plant at Malvern, Ark., and extracted wax from Arkansas lignite; the plant has been closed since 1945.

Early last year, domestic production of montan was revived[14] by the American Lignite Products Co. which is working lignite deposits at Ione, Cal. The process is based on German procedures and the earlier Arkansas project. At that time, several thousand pounds per day were being produced.

Commercial grade montan wax is a high-melting, hard, brittle wax used as an ingredient in certain polishes, electrical insulating compositions,

leather dressings, inks, carbon papers, and greases.

OZOKERITE

Ozokerite is a hydrocarbon wax which is mined mostly in eastern Europe from veins of wax shale that usually occur close to the surface of the earth. Some mining of the wax has been done in Utah and Texas. It greatly resembles paraffin wax in appearance and composition, and it is therefore relatively easy to adulterate it with the cheaper paraffins. It is separated from earthy matter by melting in boiling water and then drawing off the wax layer. The crude wax may be purified by treatment with sulfuric acid and bleaching earth. Ozokerite owes its wide use to its great compatibility with many substances and its affinity or absorptivity for oil. In this respect it is superior to paraffin wax which tends to crystallize from admixture and in so doing allows fluid components present in the mixture to "sweat" out. It is used in solvent-type polishes, electrical insulator compositions, paper and leather impregnators, and cosmetics. Refined ozokerite is often called ceresine, although a mixture of paraffin wax and beeswax is also known as ceresine, as is a mixture of ozokerite and paraffin.

SYNTHETIC WAXES

An interesting and important recent development has been the appearance of a number of synthetic waxes on the market. Most of these synthetics are waxes only in the sense that they possess physical properties similar to the natural waxes. The rather obvious duplication of natural vegetable waxes by esterification of high molecular weight acids and high molecular weight alcohols to form esters has never been commercially feasible because of the high price or commercial unavailability of the starting materials. It is possible, however, that at some future date the petroleum industry may be the source of such chemicals in the proper price range.

There are a number of esters available commercially which resemble waxes in physical properties. Esters of polyhydric alcohols are the principal members of this series. For example, ethylene glycol or diethylene glycol can be esterified with stearic acid to give high molecular weight esters of a wax-like nature. Similarly the mono-, di- and tristearate of glycerine, or mixtures thereof, are widely used. Sorbitol can also be esterified with stearic acid.

High molecular weight acids and alcohols as such have wax-like properties. Cetyl and stearyl alcohols are examples; the acids include stearic, palmitic and myristic. Most of these are sold as the technical grade products which contain varying amounts of other components.

Hydrogenated cottonseed, soybean and corn oils are wax-like products. Perhaps the best known example of this type is hydrogenated castor oil, which is mainly 12-hydroxy stearin. It is produced by Werner G. Smith and Du Pont, under the name Opalwax.

ETHYLENE OXIDE DERIVATIVES

Carbide and Carbon Chemicals Division, Union Carbide and Carbon Corp., has given the trade name Carbowax to its series of higher polyethylene glycols. Commercial Carbowax compounds are all mixtures of polymers of varying molecular weight and are grouped according to their mean molecular weight, as 1000, 1500, 4000 and 6000. Ethylene oxide can also condense with other compounds with active hydrogens, as alcohols, phenols, amines and amides to give polymers of varying wax-like properties.

The amides of higher fatty acids, as stearamide, are neutral chemicals of a high-melting, wax-like nature. Nitriles and amines of the higher fatty acids are also wax-like solids. These compounds are produced by Armour and Co. The Acrawaxes, produced by Glyco Products Co., are a series of complex nitrogen derivatives of the higher fatty acids, some of which have very high melting points.

Chlorinated paraffins may be liquid, semi-fluid or solid, depending on the type of paraffin chlorinated and the degree of chlorination. Commercial demand is for a chloro-paraffin of not less than 30% chlorine. Chlorowax is a highly chlorinated paraffin (about 70% Cl) made by the Diamond Alkali Co. Hooker Electrochemical Co. also produces a series of chlorinated paraffins. Chlorinated paraffins may be condensed with napthalene, and the latter chlorinated, or with napthalene already chlorinated, to produce hard waxes. All of the chlorinated waxes have desirable fire-retardants, and electrical-insulating properties.

The Santowaxes are synthetic hydrocarbon waxes, believed to have a terphenyl structure, and are marketed by the Monsanto Chemical Co. It is also possible to prepare a wax fraction in the Fischer-Tropsch synthesis.

MISCELLANEOUS

High molecular weight ketones as palmitone and stearone are wax-like in nature, but at present are not produced commercially. The I. G. waxes have again appeared on the American market, and a few words concerning their manufacture may be in order. Crude deresinified montan wax is oxidized vigorously to produce I. G. Wax "S," which is esterified with various alcohols or reduced to ketones and hydrocarbons. An entire series of waxes is available.[11]. In general, the various grades are used as components of wax blends to impart special properties to them.

I. G. waxes "G" and "L" are similar to "S" but made by a milder oxidation step. "E" is the ethylene glycol ester of "S"; "EG" the propylene glycol ester; "O" the butylene glycol ester. Wax "OP" is the butylene glycol ester of "S" saponified with lime. Wax "KP" is prepared by oxidizing raw montan wax (before deresinifying) and esterifying the product with a mixture of ethylene and butylene glycol. Wax "Z" is essentially a hydrocarbon; it is prepared by ketonizing the wax "S" or "L" by heating with iron powder in a closed vessel at 300° C. for 20 hours. The resulting ketones are reduced at 200 atmospheres pressure with hydrogen in the presence of a nickel catalyst at 300-335° C.

WAX BLENDS

Obviously it is possible to produce innumerable mixtures of waxes, but our discussion will be limited to those of commercial interest. Many of these mixtures have been described,[15] and are available commercially. Components added to a wax are of two general types: other waxes, generally cheaper ones, which do not detract significantly from the desired properties, and secondly, non-waxes, such as resins, cellulose derivatives, etc.

BLENDS OF WAX ONLY

The most important class here is a blend of natural waxes with the cheaper paraffins. Such blends are often referred to as ceresins. The base of these waxes is a refined paraffin; to this is added carnauba, candelilla, ouricuri or montan wax as a hardening agent and to raise the melting point, and beeswax, ozokerite or microcrystalline wax as a decrystallizing wax. Synthetic waxes are occasionally blended with natural wax to "boost" the melting point; Acrawax C may be so used, for example.

NON-WAX ADDITIVES

The addition of resins to waxes is of increasing importance. It has been known for some time that natural resins as Damars, Copals, rosin, etc., can be blended with the natural plant waxes. Synthetic resins are being used in increased amounts. For example, the addition of 10% Durez 219 resin to carnauba wax is said to give a

harder, glossier water emulsion polish. Synthetic resins which may be added to natural waxes include Durez (Durez Plastics and Chemical Co.), Shanco (Shanco Plastics and Chemical Co.), Lewisol (Hercules Powder Co.) and Piccolyte (Pennsylvania Industrial Chemical Corp.). One of the newer and more important developments has been the adoption of paraffin, micro and polyethylene blends.[10] Such blends are said to have improved tensile strength, toughness, gloss, sealing strength and blocking resistance. Addition of a small amount of petroleum wax to a commercial compound may serve to improve its water vapor resistance markedly.

In addition to the production of legitimate blends, there is a certain amount of adulteration practised by adding small amounts of any of the above relatively inexpensive materials to more expensive waxes such as carnauba.

WAX PROCESSING

PHYSICAL CHANGES

The most useful physical operation in wax operations is filtration, with solvent extraction a close second. Bleaching by means of clays may also be considered a physical operation.

In the case of the natural plant waxes, they are usually refined before use. No. 1 and No. 2 yellow carnaubas do not need refinement for most uses because of their light color and freedom from dirt. Most of the other waxes must have the dirt removed. This is done by adding the appropriate amount of filter aid and filtering through plate and frame presses. The filter cake residue is solvent leached to remove the wax contained in it, which is subsequently recovered by distilling off the solvent. As an alternative to plate and frame filtration, centrifuging is used with some waxes where the nature of the impurities lend themselves to such processing. Bleaching of the waxes may be done with bleaching clays, or chemicals.

The plate and frame and rotary filters, as well as centrifuges, used in paraffin wax processing have already been described. The solvent extraction methods used for paraffin waxes, sugar cane, and montans have also been discussed. Paraffin and microcrystalline waxes are color-refined by percolation through a vertical clay bed. The three types of bleaching clay commonly used are fuller's earth, activated clays and activated bauxite.

CHEMICAL PROCESSING

Bleaching may be accomplished as mentioned above, or it may be done chemically through an oxidation step. The preferred material for chemical bleaching of waxes in this country is hydrogen peroxide solution, which is fairly mild in its action and leaves no residue other than water.

Montan waxes are bleached by oxidizing the crude deresinified wax with either chromic acid or potassium dichromate. In the first method the chromic acid is regenerated electrically, and in the second the chrome-alum by-product is sold. Such vigorous oxidation makes a drastic change in the chemical composition of the wax. Oxidized microcrystalline waxes are of increasing commercial importance. They are prepared by blowing air through the heated wax in the presence of a catalyst, often cobalt or manganese soaps.

Various types of esterification and condensation reactions are carried out in manufacturing synthetic waxes. If the starting material is an alcohol and acid, water is a by-product. Since the ester formed is high-boiling, water can be distilled off from the reaction mixture; this can be facilitated by applying vacuum.

Paraffin wax can be chlorinated by simply melting the paraffin and bubbling chlorine gas through until the desired degree of chlorination is reached. Alternately, the wax may be dissolved in a solvent as carbon tetrachloride, and the chlorination performed.

Hydrogenations are of the low-pressure type and are carried out catalytically in low-pressure autoclaves.

GRADES AND MANUFACTURERS OF COMMERCIAL WAXES[1]

Synthetic and Blended Natural Types

Trade Name	Commercial Grades	Color	Chemical and Physical Properties: M. P.	Penetration	Acid No.	Sapon. Value	Principal Uses	Special Characteristics	Mfr. or Supplier[2]
Acrawax	Solid	Tan	95–97C.	.....	.....	.....	Lubricant; anti-tack agent for vinyl organisols; impregnating wax for leather packing highly resistant to oil and water.	Insoluble in water and cold solvents. Partially soluble in hot hydrocarbons. Soluble in hot toluol and alcohols.	13
Acrawax B	Solid	Light brown	86–90C.	.....	.....	.....	Lubricant and anti-tack agent for butyl and neoprene rubber; flatting agent.	Forms gels in mineral spirits and kerosene.	13
Acrawax C	.....	Cream-tan	140–142C.	.....	.....	.....	Anti-blocking and anti-tack agent for plastics and rubbers. Asphalt — increase melting point, decrease cold flow. Electrical applications. Cable fillers. Insulation coatings. Heat sealants; steel and alloys dry drawing lubricant; lubricant for metal powders.	Very high melting point and flash point; hardness; insolubility in water and cold solvents.	13
Acrawax CT	Solid Coarse #2 Powdered (100 mesh) Atomized (3–5 microns)	Brown							
Albacer	Solid	White	99–104C.	.....	.....	.....	Coatings. Paraffin additive. Lubricant.	Hardness and white color. Insoluble in water and alcohol. Soluble in hot hydrocarbons.	13
Alrowax 75	Flakes or solid cakes	Yellow	75C.	.....	.....	.....	Increasing viscosity of liquid detergents; foam stabilizer; thickening agent for lubricating oils; gelling and spreading agent in paste and liquid polishes, etc.	Gelling agent for both water petroleum products.	1
Alrowax 140	Fine powder or lumps	White to light cream	140C.	.....	.....	.....	For electrical condenser coatings, wire and cable insulation; in asphalt, resin and plastic compositions for increased water resistance; as a boiler defoament; in paraffin paper coatings for improved anti-blocking and laminating strength; in candles, dental impression compounds and carbon paper, etc.	High melting point, inertness, hardness; high dielectric resistance. Small amts. improve adhesion of other waxes to metal surfaces.	1
Aquawax	Refined	White, similar to Japan wax	46.8C.	.....	.....	166.6	Laundry starches lubrication for thread cords.	Similar to Japan wax with added quality of being self-emulsifiable.	
"B" Wax	1007 1008	Extra white bleached—light yellow refined	149F.	.....	20	93	Beeswax substitute—cosmetics, ointments, coatings, polishes, greases, rubber, inks, textiles and leather treating.	Excellent emulsification; does not go rancid; non-toxic.	16
Beeswax synthetic	#619	Yellow	146–150	16–18	18–20	91–96	Replace corresponding grades of natural beeswax in mfr. of cosmetics, dressings, candles, crayons, etc.	Similar to natural beeswax in properties and performance.	12
	776	White	146–150	12–14	18–20	91–95			
	1429	Amber	186–188	8–10	8–10	65–70			
Canawax	1018	Yellowish	100–110C.	.....	30–40	40–60	Shoe and leather polishes, paints, paste polishes, emulsions, inks, sizes, filler.	Very hard; inexpensive; replacement for carnauba, candelilla, ouricury.	16
Candelilla Substitute	#1438	Amber	167–169F.	3–5	5–6	58–62	Used in same applications as natural candelilla wax, such as cosmetics, dental compounds, chewing gum, etc.	Are non-toxic materials which closely resemble natural candelilla wax in properties and performance.	12
	#1448	Amber	166–168	4–6	4–6	64–68			
	#1471	Amber	153–156	5–7	5–7	58–62			
Carbowax Compound 1000	1000	Cream	.....	.....	.....	.....	Chemical intermediate in preparation of fatty acid esters; pharmaceutical bases; textile lubricants and sizes.	Water solubility	4
	1000W	White	.....	.....	.....	.....			
Carbowax Compound 1540	1540	Cream	.....	.....	.....	.....	Chemical intermediate in preparation of fatty acid esters; pharmaceutical bases; textile lubricants and sizes.	Water solubility.	4
	1540W	White	.....	.....	.....	.....			
Carbowax Compound 4000	4000	Light yellow	.....	.....	.....	.....	Release agent for rubber molds; lubricant for certain extrusion operations; textile lubricants; release films for decalcomania transfers; medicament bases; dispersing agent for hormones and dyes; binder for ceramic colors, pigments, water paints, kalsomines, and water-soluble crayons. Cake vehicles for plant hormones, herbicides, detergents.	Hard, translucent solid which is water soluble.	4
	4000W	White	.....	.....	.....	.....			
	4000 U.S.P.	White	.....	.....	.....	.....			
Carbowax Compound 6000	6000	Light yellow	.....	.....	.....	.....	As above.	Hard, translucent solid which is water soluble.	4
	6000W	White	.....	.....	.....	.....			
Carbowax Compound PF-43	50% aqueous solution	Tan	.....	.....	.....	.....	Sizing, lubricating, and binding agent in textile compounds; as a binder in ceramics, chalk, crayons, sand molds, metal powders, and detergent cakes; as a lubricant in paper and textile calendering operations.	Water solubility; remarkable toughness and resilience; excellent adherence to most surfaces.	4
Casting Wax	#1546	Amber	156–158	2	12–13	35–37	Used for precision casting of jewelry and of machine tools.	Yields low shrinkage and distortion; can be injected at moderate temperatures.	12
	1547	Amber	156–158	2	10–11	33–35			
Ceramid	Solid	Yellow	79.5–80.5C.	.....	.....	.....	Anti-tack agent. Flatting agent. Lubricant. Wax blends.	Soluble in cold solvents in low percentages.	13
Cerax	#1320	Yellow	190–191F.	0–1	2.5–2.6	170–175	Carnauba replacement in paste polishes (solvent type).	Excellent solvent binding power; produces high gloss and smooth textured paste.	12
Cerita	27	Brown	85C.	.....	0	20–25	All paste polishes.	.....	18
	83	White	49–50C.	.....	22	190	General Japan wax uses.	.....	18
	86	Lt. yellow	62–65C.	.....	2	123	General Japan wax uses.	.....	18
	135	White	52C.	.....	3.3	201	General Japan wax uses.	.....	18
	111	Off-white	85C.	.....	5–7	169–170	Replace carnauba wax in paste polishes for floors, shoes, autos.	.....	18
	143	Light candelilla color	83–84C.	.....	4	94	Candelilla replacement for paste polishes.	.....	18

1. Suppliers of natural types, properties of which are given in Table I, can be found in CHEMICAL INDUSTRIES BUYERS GUIDE.
2. Numbers refer to manufacturers and suppliers listed in Table II.

Synthetic and Blended Natural Types

Trade Name	Commercial Grades	Color	Chemical and Physical Properties: M. P.	Penetration	Acid No.	Sapon. Value	Principal Uses	Special Characteristics	Mfr. or Supplier
Cerita	146	Light candelilla color	69–70C.	.....	18	70–71	Candelilla replacement for use in gum.	.....	18
	77	Brown	79C.	.....	18	51	General carnauba wax replacement.	.....	18
	519	White	62C.	.....	21.1	96.3	Beeswax replacement, white; general beeswax use.	.....	18
	501	Lt. yellow	62C.	.....	21.1	96.3	Beeswax replacement, yellow; general beeswax use.	.....	18
Ceroflex	#1610	Lt. yellow	214–218F.	3	0	0	Excellent additive to other waxes in pastes; also good carnauba replacement in mfr. of records and plastics.	Unusually high melting point and flexibility. Films produced are non-hazy and non-brittle.	12
Chlorowax 70	.....	Cream powder	95–110C.	.....	.....	.....	Paints; textile treating; polishes; emulsions; dispersions; printing inks.	Fire retardant; water repellent.	7
Concord Wax #159	Refined	Light brown similar to carnauba	84C.	.....	.....	66.9	Carnauba wax replacement for water wax emulsion, floor polish, paper sizing and polish, citrus fruit wax dips, protective coating, leather finishing and dressings.	Produces excellent water wax emulsion of fine particle dispersion, good gloss, waterproof and wearing qualities.	5
Concord Wax #190	Refined	Light brown similar to carnauba	90C.	.....	.....	19.9	Carnauba wax replacement for paste and liquid solvent polishes, leather, packings, phonograph record mfg., etc.	Higher melting point than carnauba, compatible with most mineral and vegetable waxes.	5
Cornelowax	#1678	Brown	275–285F.	3	10–15	16–18	Used as mold lubricant for foam rubber and in electrical insulation.	Has high electric volume and surface resistivity and is unusually water-resistant.	12
Cornelowax	#1822	Amber	199–201	3–4	11–13	60–62	Carnauba replacement in solvent paste polishes, also for liquid solvent waxes. Used also in carbon paper mfr.	Unusual solvent retention qualities; produce non-shrinking pastes of high quality and firm carbon paper surface.	12
	1800	Lt. brown	165–170	8–10	45–48	80–85	Base for water emulsion paste wax used on asphalt tile flooring.	Produces non-slip water-resistant film which will not injure asphalt tile.	12
Diglycol Stearate S	Beads	White	54–59C.	.....	.....	0.96	Anti-tack agent for raw rubber. Lubricant for aluminum and tin, rubber and vinyls. Plasticizer for paper, etc.	Water dispersibility. Lubrication.	13
Durawax	#772	Gray	158–162F.	0–½	8–9	22–25	As hardening agents for softer waxes in various types of application: mfr. of candles, cosmetics, pencils, etc.	Produce no shrinkage or distortion when molded; #1032 especially good in cosmetics, etc., because nontoxic.	12
	1032	Lt. amber	184–186	½–1	1–2	15–18			
	1227	Yellow	188–192	1–2	25–30	53–55			
Durez 13069	.....	Medium brown opaque	140–145C.	.....	.....	.....	Coatings for cellophane, paper; electrical insulation.	High m.p.; excellent electrical properties and water resistance; does not emulsify readily, but modifications do.	10
Emulsowax	#1214	Amber	162–165F.	0–½	28–32	103–110	Used in place of carnauba wax or other hard vegetable waxes in manufacture of water emulsion (self-polishing) waxes. In addition to use in floor polishes, etc., also serve as base for various types of spray applications on rubber, tiles, paper, etc. Used in bright-drying leather finish compounds.	Produce a smooth, glossy finish without buffing. Are non-tacky and slip-resistant. Have good wearing qualities. Are cheaper than standard vegetable waxes. Are readily emulsified and form good dispersions.	12
	1508	Amber	162–165	0–½	30–34	119–126			
	1214A	Amber	162–165	0–½	28–32	103–110			
	1508A	Amber	162–165	0–½	30–34	119–126			
	1742	Lt. brown	176–178	0–½	24–26	108–112			
	1825	Lt. brown	180–182	1–2	39–41	61–63			
	1530	Brown	180–185	0	22–26	110–120			
	1630	Amber	178–182	0	20–25	105–110			
	1760	Lt. brown	178–180	1–1½	28–30	80–84			
Flexo Wax C Lt.	Slabs	Cream	57–61C.	.....	.....	.....	Adhesives.	Tacky, plastic.	13
Flexo Wax C	Solid	Amber	63–65C.	.....	.....	.....	Adhesives. Coatings, waterproof. Lubricant. Water repellent.	Plastic and adhesive.	13
*Gersthofen Wax O & OP	.....	Light yellow	102–106C.	10–15	110–125	.....	Paste polishes. Leather dressing.	Can absorb very large amounts of organic solvents and hold them bound.	17
Gersthofen Wax E	All grades	Yellow	78–82C.	15–20	155–175	.....	Liquid polishes.	Very easily saponified and emulsified; has light color, good luster, and crystalline structure.	17
Gersthofen Wax S	All grades	Very light yellow	80–83C.	.....	145–160	165–185	Carbon paper, leather dressing.	Pronounced crystalline type of bright color; very hard; gives high luster with no cloudiness. Pronounced absence of tack in film.	17
Gersthofen Wax L	All grades	Light yellow	80–83C.	.....	125–145	150–170	Carbon paper, leather dressings.	.....	17
Gersthofen Wax Special	All grades	Very dark brown	90–93C.	.....	13–18	95–110	Shoe polishes.	Fine luster in shoe polishes; designed for black shoe polish especially.	17
Gersthofen Wax CR	.....	Very dark brown	90–93C	.....	13–18	95–110	Shoe polishes.	Similar to Wax E in emulsifiability but darker; used with Wax Special in black shoe polish.	17
Gersthofen Wax KP	.....	Light tan	80–83C	.....	20–30	130–145	Carbon paper.	Very similar to carnauba; hardness and fine crystalline structure designed for carbon paper.	17
Gersthofen Wax KPS	.....	Yellow	80–83C.	.....	20–30	130–145	"No rub" floor polishes.	Easily emulsified to give products that dry to bright luster; neutral emulsifier preferred for self-polishing emulsions.	17
Glyco Wax S932	Flakes	White	57–61C.	.....	.....	.....	Greaseproof coatings, wax blends. Plasticizer for chewing gum.	Edible.	11
Inkowax	H 1226	Yellow	183–185F.	.....	26–28	64–67	Used as carnauba replacement in mfr. of printing inks and lithographic varnishes.	Produces glossy, hard-surfaced inks at lower cost than carnauba wax; also has good slip.	12
Intawax	1015	Amber	.....	.....	.....	.....	Same as Canawax, but also used in "no-rub" polishes.	.....	16
Isco Beeswax Substitutes	#662	Yellow	62–65C.	.....	17–19	90–94	Same as for beeswax.	Emulsifiable.	15
	#663	Yellow	62–65C.	.....	17–19	90–94			
Isco Japan Wax Substitute	#525	Cream	135–136F.	.....	9–10	186–190	Textile finishes, crayons.	Emulsifiable.	15
Karagami Wax	Refined	White, identical to Japan wax	50C.	.....	6.8	199.4	Japan wax replacement for: Laundry waxes, laundry glazes, polish creams, textiles finishes, metal drawings, lubricants, sizing compounds.	Chemical and physical characteristics identical to Japan wax. Used for most every purpose where Japan wax formerly used.	5

** Gersthofen waxes are produced in the same plant and according to the same process as the former IG waxes.*

Synthetic and Blended Natural Types

Trade Name	Commercial Grades	Color	Chemical and Physical Properties: M. P.	Penetration	Acid No.	Sapon. Value	Principal Uses	Special Characteristics	Mfr. or Supplier
Nipocera	#966 988 979	White White White	125–130F. 125–130 133–136	22–24 20–25 22–24	1.5–2.5 2–5 2 max.	190–198 180–200 180–190	Replace natural Japan wax in mfr. of buffing compounds, pencils, leather dressings, textile finishes, etc.	Similar to natural Japan wax in high saponification value and in general performance.	12
Opalwax	.....	Pearl white	85–88C.	.....	3.0 max.	.....	Hot melt adhesives; electrical impregnant; wood finishes, leather dressings; metal drawing lubricant, paper coating, impregnating; rubber; textile finishes.	Good electrical properties; very hard, brittle and practically odorless.	8
Palmeto	1019	.....	.....	.....	.....	.....	"No rub" polishes.	Makes stable non-tacky "no rubs" at low cost.	16
Parwax	Refined	Light brown similar to carnauba.	93C.	.....	12	61	Carnauba wax replacement specifically for carbon paper industry. Excellent for use in solvent polishes.	Gloss, oil retention, solvent retention considerably better than carnauba. Viscosity and melting point equal to carnauba.	5
PIW	#1629 1631 1632	White White White	194–196F. 191–193 195–197	6–7 12–14 18–20	0 0 0	0 0 0	Used in mfr. of protective packaging and other types of wax-treated papers; also in electrical and other products for hot melt coatings.	Are pliable, tasteless, odorless and non-toxic. Highly resistant to penetration by water or by fats. Have good adhesive qualities.	12
Rezo Wax B	Solid and Beads	Brown	95–110C.	.....	.....	.....	Lubricant for phenol-formaldehyde resins. Montan wax replacement.	Very hard; dispersible in hot water; soluble in hot hydrocarbons.	13
Santowax R	.....	NPA—3.5–4.5	60–145C.	.....	.....	.....	Constituent of wax and lacquer type coatings for paper as moisture proofing compositions for the packaging industry.	Good heat stability and does not react with 10% H_2SO_4 or 10% NaOH.	19
Seed Coating Wax	#1679A	Brown	133–135C.	35–40	0	0	Used in emulsion which acts as sticker for agricultural fungicides.	Permits obtaining of good results with lower quantity of fungicide; has good adhesion.	12
Solvawax	#1292 1402	Lt. gray Lt. gray	188–192C. 180–182C.	2–4 3–5	19–21 16–18	145–150 128–135	Carnauba replacements in liquid solvent polishes for floors, furniture, woodwork, etc.	Produce stable, non-settling polishes of low viscosity which yield high gloss on buffing.	12
Stroba Wax	Solid	Tan	98–102C.	.....	.....	.....	Flatting agent. Wax blends. Paste polishes.	Gelling agent for hydrocarbons, hard, good luster.	13
Syrex 100	One grade only	Similar to #3 carnauba	174F.	.....	7–9	21–24	Hard wax replacement.	Specially adapted for use in polish formulations, including "dry-bright" type. Readily emulsified.	28
Syrex 200	One grade	Light amber (Similar to #1 carnauba)	190F. (soft pt.)	.....	.....	.....	Hard wax replacement, especially in polish formulations. Addition to polish formulations containing hard wax resilts in increased transparency, luster, and durability.	Natural film former. When modified with softer waxes, can be made to simulate hard wax. Acts as a mutual solvent in hot melts. Recommended particularly for use in "dry-bright" formulations. Readily emulsified.	28
Wax No. 1001	.....	Light tan	78–80C.	.....	14	70	Water and paste waxes and other carnauba uses.	Carnauba substitute; also can replace candelilla and ouricuri.	16

Mineral Waxes

Cerelne	#901 #902 #891 #725 #275 #375	White, yellow	127–130F. 130–135F. 135–140F. 140–150F. 150–160F. 160–165F.	.....	.....	.....	Candles, carbon paper, cosmetics, crayons and pencils, dental compounds, food coatings, printing inks, insulating leather finishes and dressings, lubricants, paper coating, etc.	.....	12
Ceresine	Various melting points	White Yellow Orange	Various	.....	.....	.....	Textiles, paper, polishes.	Chiefly compounds of various types.	15
Montan, American	#1950 #1644	Dark brown Dark brown	180–185F. 180–190F.	½–1 1–2	0 35–44	0 75–80	Leather finishes and dressings, phonographic records, carbon paper, waterproofing rope, etc.	.....	12
Montan, Bohemian	Crude lump and powder	Br-Black Brown	172–177F.	.....	.....	.....	Insulation, rubber compounding, plastics.	Hard and brittle.	15
Montan	German Czecho-slovakian	Dark brown Dark brown	180–190F. 175–185F.	0–½ 0–1	28–35 30–40	65–75 65–75	Similar to American Montan.	.....	12
Durmont 500 Refined Montan	Prime	Light tan	88.5C.	¾	3.8	37.1	Manufacture of solvent type polishes. Carbon paper inks and carbon paper back coatings. Wax compositions.	High oil and solvent absorption power. Excellent gloss, hardness. High melting point.	9
Ozokerite	#869 #870 #861 #863 #871 #447 #646	Amber White Amber Yellow White Amber Yellow	170–175F. 170–175F. 190–195F. 190–195F. 190–195F. 195–200F. 195–200F.	15–20 15–20 5–10 2–7 2–7 2–5 3–8	.....	.....	Similar to ceresine.	.....	12
Three Star Ozoke.ite	#1055 1066	Snow-white Natural yellow	195–8F.	.....	.....	.....	Cosmetic cream, ointments, leather and textile dressings, adhesives, containers, paper; substitute for carnauba and beeswax in certain applications.	Prevents lumps or crystals; won't sweat; mixes readily with all waxes; makes opaque creams; high oil absorption and retention capacity.	16
Ozokerite Utahwax	#1 #3 #4 #5	Black Black Lt. yellow White	189–190F. 171–172 172–173 172–173	½–1 1½–2½ 7–8 7–8	.....	.....	Cosmetics; carbon paper inks; printing inks; shoe, floor, furniture and auto polishes; crayons; sealing, insulating and water-proofing compounds.	Tough, dry, hard waxes. Thin coat covers completely. Emulsifiable, soluble in hot solvents, compatible in all proportions with all waxes; unaffected by acids or alkalies.	20

Tervan 2536	1	Yellow	175	...	.....	.....	Food packaging, beer can linings, polishes, etc.	Hard, dry, moderately flexible. Microcrystalline.	11
Tervan 2850	1	Off white	126	...	.....	.....	Coating of milk cartons and other food containers.	Strength and flexibility. Odorless, tasteless blend.	11
Warco Wax	#155	Brown	153–158	...	20–25	.....	Paper coating.	Plastic and flexible, high tensile strength and water vapor resistance. Microcrystalline pertolatum wax.	29
White Crude Scale Wax	1	White	126	...	.....	.....	Devotional lights, manufacture of chemicals, etc.	Highest quality scale wax. Paraffin containing about 2% oil.	11

Waxes for any desired use can be made at Sun Oil Co.'s flexible new wax plant which the company says permits production of waxes previously unobtainable. This is just one example of a higher melting point paraffinic type wax.
Note: *The Texas Co. has manufactured petroleum waxes, and will continue to make a variety of such products, but its new plant at Port Arthur, Tex. is just going into production and data on the grades to be produced are not yet available.*

IF YOU USE HYDROGEN AT THE RATE OF . . .	YOU SHOULD . . .
over 20,000 ft³ per day	build a hydrogen-producing plant
12,000-20,000 "	consider dissociating tank-car ammonia
8,000-12,000 "	probably buy trailer-truck hydrogen; possibly dissociate cylinder ammonia
less than 8,000 "	consider dissociating cylinder ammonia

HABER IN REVERSE

REVERSING THE HABER PROCESS to supply hydrogen may look as foolish as burning diamonds to make dry ice, but dissociation of ammonia is actually the cheapest source of hydrogen for the small-scale user.

HAVING been described as early as 1934, the idea of dissociating ammonia to provide hydrogen is not new; but it is only in the past few years that commercial interest in the process—sparked by Armour & Co.'s Ammonia Division—has developed to the point where there's something to talk about.

Most applications have been in the metallurgical field, where an inert atmosphere is required for such operations as bright heat treating, formation of metal powders, furnace brazing, and so forth.

Now, however, chemical uses are coming to the fore—particularly hydrogenation of fats and oils. Armour has developed a process through its pilot plant work, and the patents covering it are being licensed to plant-scale users.

DISSOCIATION PROCESS

The ammonia dissociator consists of an electrically-heated or gas-fired chamber through which the gas is passed. Pressure of the gas is usually a maximum of 20 psig and temperature is normally within the range of 1650 to 1850 F. A catalyst is usually employed to hasten attainment of equilibrium (0.01% residual ammonia) and to provide better heat transfer. Nickel shot is commonly used, as are ceramic balls impregnated with iron oxide. In any case the active catalyst is a metal nitride formed by the reaction of the metal or its oxide with ammonia.

Equipment is being made by several firms, including The Drever Co.; General Electric Co.; Westinghouse Electric Co.; Sargeant and Wilbur, Inc.; C. I. Hayes, Inc.; and Lindberg Engineering Co.

About 1945 Armour started investigating dissociated ammonia for fat and oil hydrogenation, for the process looked economically attractive—especially for small hydrogenators and those whose operations were more or less irregular. Larger processors usually install one of the conventional hydrogen plants.

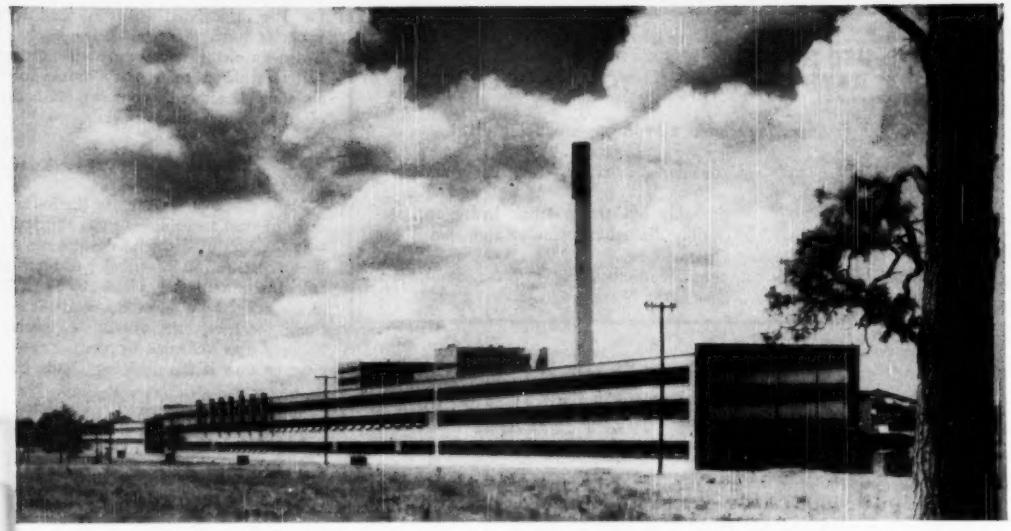
But a minimum investment of $100-000 for a plant rated at 2,000 ft³/hr is a major cost, especially if operation is sporadic or seasonal. Equipment cost for ammonia dissociation, on the other hand, is only about a fifth of that for other types for the same rated capacity.

In the first pilot-plant tests, dissociated ammonia was introduced into the closed hydrogenation kettle until the reaction rate indicated a nitrogen build-up. The gas was then turned off and time allowed for maximum hydrogen up-take. It was found that this type of operation used up excessive time and excessive hydrogen.

A technique was ultimately worked out which may be described as a continuous vent-constant pressure method. By venting the nitrogen at a rate equivalent to its influent rate, equilibrium is established and hydrogenation proceeds, affected solely by the partial pressure of hydrogen. Consumption of the latter is comparable, using this technique, with hydrogenations using conventional hydrogen sources.

The full-scale plant set-up is practically automatic. Heat contained in the hot dissociated gases is used to vaporize liquid ammonia. The cooled hydrogen-nitrogen mixture is then water-scrubbed to remove traces of ammonia, metered, compressed and piped to storage at 300 psi.

COMPARATIVE COST



Freight—or one might say the lower ratio of steel to volume of gas shipped—is the nub of dissociated ammonia's lower cost. A 150-lb. cylinder of liquid anhydrous ammonia yields 6,750 ft³ of dissociated gas. For many applications, moreover, the absence of such impurities as moisture, oxygen, or catalyst poisons is the deciding factor in its selection.

The decision between dissociated ammonia and standard hydrogen-producing plants generally boils down to the anticipated daily consumption. If it is over 20,000 ft³/day most consumers would set up a hydrogen-producing plant. At consumptions in the range of 12,000 to 20,000 ft³/day dissociation of tank-car ammonia (a car containing 26 short tons) is the most economical hydrogen source. The 8,000 to 12,000 ft³/day range is the "twilight zone" where it's a toss-up between trailer-truck hydrogen or dissociation of 150-lb. cylinder ammonia, with most bets on the former. Below 8,000 ft³/day dissociation of cylinder ammonia is economically favorable.

Cost of hydrogen in 200 ft³ cylinders varies from as low as $7.50 per M ft³ to as high as $20.00 or $22.00, depending on distance from the cylinder filling plant. Dissociated tank-car ammonia will cost about $2.00 per M ft³, including ammonia, power, labor, catalyst replacement every three years, and amortization (at average rates) of initial investment for process and storage equipment. Dissociated cylinder ammonia, on the other hand, would cost about $4.25 per M ft.³ (These costs are based on an 80 hr/week schedule of operation.)

From these figures it is clear that hydrogen from hydrogen producing plants compares favorably with dissociated ammonia when consumption is over 20,000 ft³/day or in the limited zone of 8,000 to 12,000 ft³/day where it is not practical to install ammonia storage equipment and where trailer-truck hydrogen—which compares favorably in cost with dissociated cylinder ammonia—is available.

Other factors of less direct effect have an important bearing on the cost of dissociated ammonia *vs* hydrogen. One 150-lb. cylinder of ammonia, it should be remembered, produces about 6,800 ft³ of gas—equivalent to 33 cylinders of hydrogen. The savings in handling are thus considerable.

Chemically significant is the fact that International Paper Co.'s new mill uses hardwoods to make . . .

Dissolving Pulps by Sulfate Process

INTERNATIONAL PAPER COMPANY'S NEW NATCHEZ MILL is important for many reasons: It's the first dissolving pulp mill in the South designed to utilize hardwoods by means of the sulfate (kraft) process for its 100,000-ton annual output.

AN INCREASE of 13% of the present estimated North American dissolving pulp capacity will be afforded by International Paper Co.'s new Natchez mill, which recently came into operation.

Natchez was selected as the site because of its proximity to 250,000 acres of company-owned timberland. For the first time in the manufacture of rayon pulps, hardwoods (gums, bay, poplar) instead of softwoods will be largely utilized; and they will be treated by the sulfate instead of the traditional sulfite process used heretofore. Production capacity of the first unit is 300 tons a day, or 100,000 tons a year; two additional units can be added as demand grows. Of dissolving grade, the pulp can be used for rayon, cellophane, or cellulose plastics.

DONE WITH CONVEYORS

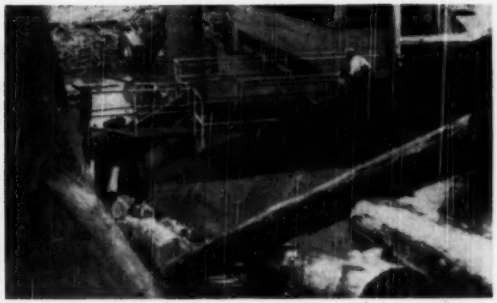
Logs of about 5 ft. in length are delivered by truck or rail and unloaded by crane or hand to storage. Cranes pick up the wood from storage and deposit it in a water conveyor, which carries it to the process. An escalator carries the wood from the flume to mechanical conveyors, which bring it to two hydraulic barkers.

The debarked wood is sorted and acceptable logs are chipped and screened. The sized chips go by belt conveyors to tile silos for storage. Thence they go by belt conveyor to the eight carbon-steel digesters, each of which is 13 ft. diam. and 57 ft. long. A shuttle conveyor arrangement permits loading of the various digesters as required by the cycle. After cooking, the charge is blown into a blow tank and thereafter washed.

The washed pulp is screened, thickened, further washed and discharged to storage. From the storage chests the pulp goes to a multi-stage bleach plant with washers between stages. The bleached pulp is screened, again thickened, and further washed, whereupon it is discharged into storage chests that furnish the pulp drying machine.

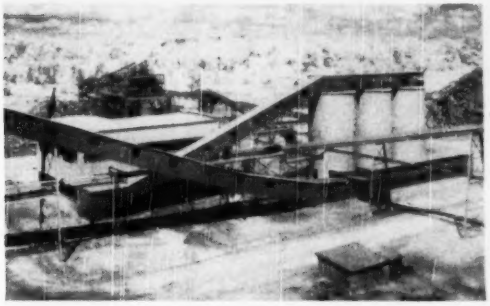
After passing through a Jordan refiner and a further cleaning step the pulp goes to a Fourdrinier pulp dryer, emerging as a 220-in.-wide sheet resembling blotting paper. The 7-ft.-diam. rolls of dried pulp are cut to required sheet size, the sheets are conveyed to baling presses, and on a subsequent conveyor the bales are weighed, wrapped, tied and sent to storage. Cranes handle the bales for shipment.

LIQUOR, SODA RECOVERY

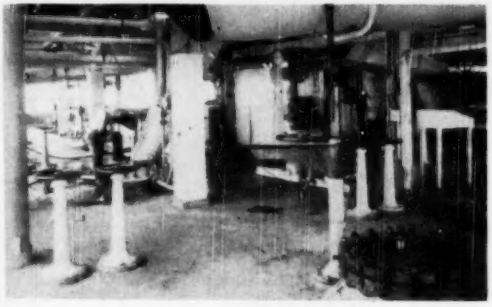


The bark is crushed and conveyed to a bark-burning boiler, while the spent black liquor is evaporated and burned in two soda recovery boilers. The smelt from these units is clarified and causticized to produce sulfate cooking liquor, and the lime mud from the caustic plant is reclaimed by burning.

High-quality water is an essential raw material for a pulp plant, and the system provided at Natchez can soften and filter 30 million gallons a day. Two turbogenerators can supply 13,500 KW, and two boilers can provide 300,000 lb./hr. of 600-lb. steam.

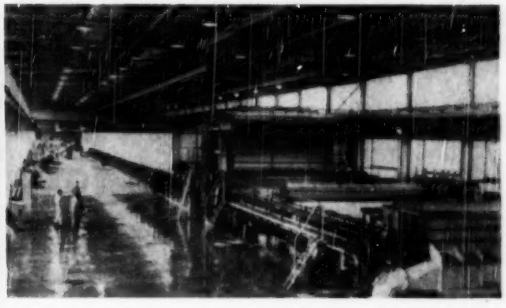


Research leading to the new process was carried out by the company's Southern Kraft Division with the technical assistance of Industrial Cellulose Research, Ltd., a research affiliate of Canadian International Paper Co. Output of the new mill, together with Canadian International's 225,000-ton annual capacity, gives the affiliated companies over a third of North American dissolving pulp capacity.

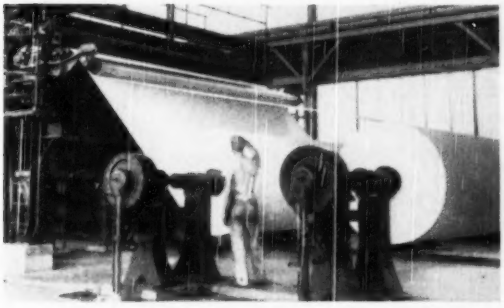


Woodyard superintendent checks logs moving along an escalator conveyor towards the mill's specially designed hydraulic barkers.

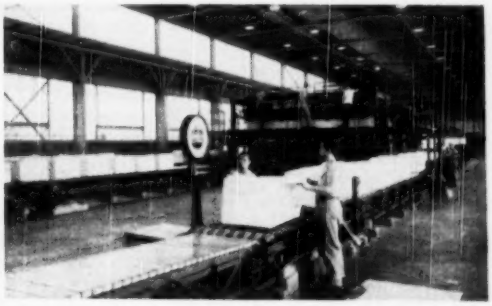
The debarked wood is sorted, and acceptable logs are sent up an escalator conveyor to chippers. Chips are screened for proper size.



Oversize chips are recycled, and sized chips are carried along a belt conveyor to be stored in tile silos before conversion to pulp.

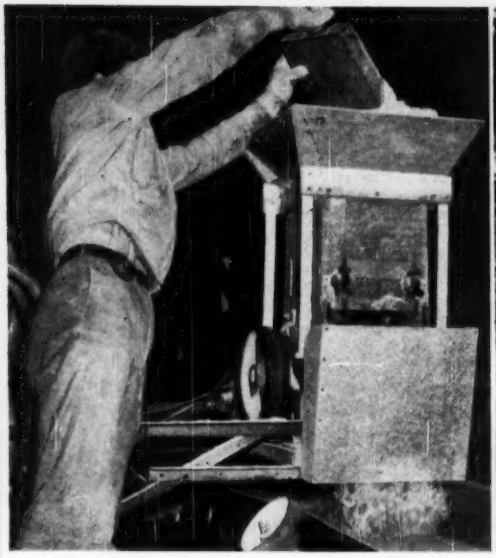


Another belt conveyor carries the chips to carbon-steel digesters, each of which is 13' diam. and 57' long, where chips are pulped.



Machine room superintendent checks blending chest, where screened, thickened and bleached pulp is blended to give a uniform product.

Finished pulp goes to wet end of drying machine. Dryer is divided into five parts and is completely covered by a removable 302' hood.



Pulp emerges as a 220" sheet, resembling blotting paper, wound up to form 7' rolls which are cut into sheets of required size.

Sheet pulp is weighed before it is conveyed to baling presses. Bales are wrapped, tied, and sent to storage for subsequent shipment.

CHEMICAL SPECIALTIES

GRAIN PROTECTION during storage achieved with insecticides. Here Pyrenone Wheat Protectant is blended with wheat.

DUSTING POTATOES with CPR dust to control Colorado potato beetle shows widening use of pyrethrum with synergists.

Synergists Widen Scope of "Non-Toxic" Insecticides

by MELVIN GOLDBERG
Pesticide Advisory Service, New York, N. Y.

PIPERONYL BUTOXIDE is principal activator for natural pyrethrum as demand for "safe" products spurs work on extenders for expensive natural insecticides and for allethrin.

SUCCESSFUL INTRODUCTION of the first truly synthetic insecticide, DDT, ushered in a new era in insect control that many thought meant replacement of natural materials such as pyrethrum and rotenone. DDT and some of the other organic insecticides have won a very secure place among both household and agricultural chemicals, but problems of insecticide-resistant insects and toxicity to people and other warm-blooded animals have made it clear that there are definite limitations as to how, where and under what circumstances these synthetic materials can be used.

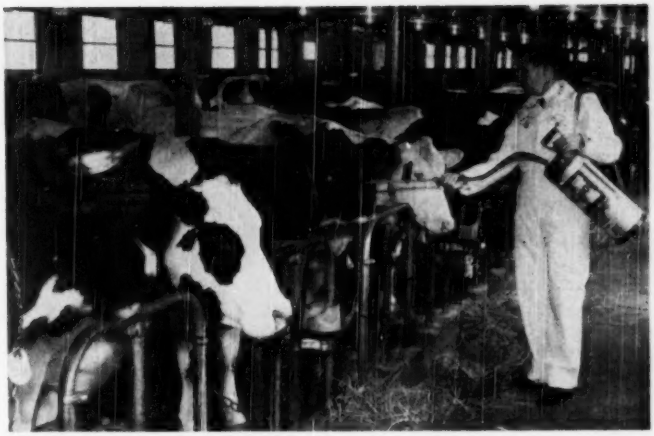
Instead of being relegated to the "has been" class, pyrethrum is now as highly prized as ever for its particular advantages of non-toxicity to higher animals and quick knockdown of insects. It has always been a relatively expensive material and chemists have tried to make its use more economical by developing chemicals to increase its effectiveness — commonly called synergists, although the terms "activator" and "extender" are also used—and have sought to prepare it synthetically.

There is no acceptable definition for synergists as they apply to insecticides, but a common rule of thumb definition is that a product exhibiting synergistic properties with pyrethrum is one that will synergize pyrethrum over a wide range of different formulations, and one which will be effective against most insects which pyrethrum alone will control. Thus the terms activator and extender generally will apply to materials which may specifically extend or activate pyrethrum in certain instances only.

With current emphasis on "safer" insecticides, synergists are being

widely exploited and new ones are under development. Moreover, commercial availability of a synthetic pyrethrum-like material—allethrin—has brought the need for new synergists.

The exact action of synergists for insecticides is not fully understood. In some cases, a material that is a synergist for pyrethrum may have no such effect on another insecticide. Also, a synergist for pyrethrum against the housefly may have no synergistic action against the cockroach or other insects. Some synergists have insecticidal value themselves, while others have no value as insecticides when used alone.



NATURAL PYRETHRUM

In the search for pyrethrum synergists, the chemist is allied with the entomologist who has found this material, or more correctly, pyrethrins—the active ingredient of pyrethrum flowers—a valuable insecticide. It is the leading member of the so-called non-toxic group of insecticides, having been the essential ingredient in household fly sprays for over 25 years, and always having had some agricultural use. We have imported pyrethrum flowers from the British West African colonies of Kenya and Tanganyiki and from Belgian Congo where they have been a major crop since the early 'thirties. Prior to that time, Japan was our major supplier. Small quantities are still grown in the Argentine, Brazil and some Mediterranean countries.

For the most part, pyrethrum has been used in this country in household insecticides, and its popularity reached its height in the middle 'thirties after a degree of standardization was achieved so that both flowers and extracts were sold on the basis of standard chemical analyses.

SAFE AROUND FOODSTUFFS. Pyrenone spray is used to kill cockroaches under sink.

FLY CONTROL in barns and on cows calls for safe, effective insecticides. Pyrenone sprays, combinations of pyrethrum and piperonyl butoxide, fill the bill.

As the cost of pyrethrum rose, use of synethtic substitutes as well as synergists began to occupy many research workers in this field. Rohm & Haas Co. introduced its series of liquid Lethanes (aliphatic thiocyanates) and Hercules Powder marketed its Thanite, a terpene thiocyanate derivative used as a substitute and also in conjunction with natural pyrethrins.

WAR IMPETUS

Early in the last war, pyrethrum became extremely tight because of increased military demands and smaller supplies from Africa. (Normal annual imports into this country had been running between 15 and 16 million pounds of flowers containing 1.3% pyrethrins.) What supplies did come in during the war years were channeled into military uses (chiefly aerosol bombs to combat malaria-bearing mosquitoes) and work on the use of synergists and substitutes was pressed.

One of the first synergists used for pyrethrum was Du Pont's I.N. 930, chemically isobutyl undecylenamide. This synergist is no longer being used in view of more efficient and more economical materials now available.

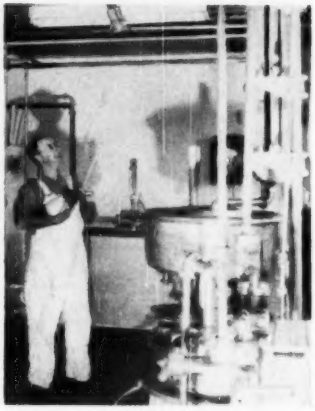
Haller[1] and his co-workers in the Department of Agriculture, in following up a discovery by Eagleson[2] that addition of sesame oil to pyrethrum extracts increased their effectiveness, separated the various fractions in sesame oil by molecular distillation. These investigators linked the synergistic effect of the sesamin in the oil with the presence of a methylenedioxyphenyl group in the sesamin. This was closely related to piperonal which is 3,4-methylenedioxybenzaldehyde. However, another compound which contains this group is piperine, the alkaloid from black pepper. This material, piperine, showed itself to be a good synergist for pyrethrum, but its value as an insecticide was low.

Because certain amides and other piperonyl compounds were effective synergists for pyrethrum, it was thought worthwhile to investigate compounds possessing both these groups. Twenty-six of these compounds were prepared and tested; some were found to be extremely active as synergists. However, they did not become commercial materials because they couldn't be prepared economically or were of limited solubility in petroleum hydrocarbons and other solvents for insecticidal sprays.

PIPERONYL BUTOXIDE

Meanwhile, O. F. Hedenberg[3] of the Mellon Institute for Industrial Research, who had been searching for a chemical that would not poison man or animals but could be used in making efficient insecticides, had been intensively investigating combinations containing the methylenedioxyphenyl group. The chemicals alone did not appear too promising because of their poor knockdown properties, but when tested in combination with natural pyrethrins, a positive effect was obtained. A number of compounds tested, including safrole and isosafrole and related compounds, displayed little or no activity. One, however, the condensation product of alkyl-3,4-methylenedioxystyryl ketone with ethyl acetoacetate, showed outstanding activity.

A solution of 300 mg. of this sub-



stance in combination with 30 mg. of pyrethrins gave 99% knockdown and 90% kill of houseflies when tested according to recognized test methods. On the other hand, 30 mg. of pyrethrins will give a knockdown of a little better than 80% and a kill of about 15%; 300 mg. of the condensation product dissolved in 100 c.c. of base oil under the test conditions gave a knockdown of less than 10% and, therefore, practically no kill.

Although this was encouraging, the material had to be used with secondary solvents. The search continued, and a material of increased activity and of complete miscibility with Freon (used in aerosol bombs) and petroleum hydrocarbons was developed. This compound, 3,4-methylenedioxy-6-propyl benzyl (butyl) diethylene glycol ether,[4] was called piperonyl butoxide. It shared with pyrethrins the property of being "practically non-toxic" to warm-blooded animals. The commercial preparation contains 80% of the pure product.

Piperonyl butoxide is manufactured by U. S. Industrial Chemicals, Inc., which sells it as a technical chemical as well as in combination with pyrethrum under the trade name Pyrenone, and in combination with pyrethrum and rotenone as CPR concentrates for agricultural uses. The combination of the synergist and natural materials has advantages of stability and economy as well as residual effectiveness which pyrethrum or retenone alone does not possess. Non-toxicity to mammals, ease of formulation and rapidity of action are other factors responsible for their acceptance on truck garden crops, in cattle dips and sprays, household aerosols, for fly control around dairies, etc. Moreover, the use of Pyrenones as emulsifiable concentrates has opened up a new field of activity for pyrethrum, since previously it was only rarely used in this form. Piperonyl butoxide, with its stabilizing effect on pyrethrum, as well as its synergistic activity, has made this economical form of application possible.

The most recent extension of the Pyrenones is their use on stored wheat and other grains and seeds to protect them against insect infestations. Two new products have been developed for this application, but distribution is to be limited this year, with an expansion of availability planned for 1951. This development can be of considerable significance, as the loss of stored grain and seeds in this country often runs as high as a quarter of a billion bushels a year. Obviously, only an absolutely harmless insecticide can be used in this way.

The economy of the Pyrenones can be judged by comparing the current price of 20:1 pyrethrum concentrate, which is about $9 a gallon, with that of an equivalent Pyrenone combination, which is about $4.50 a gallon. Roughly the same concentration of either material will do a given job. Technical piperonyl butoxide is available at about $4.50 a pound.

AEROSOLS of pyrethrum-base Pyrenones kill flying insects in cream separator room.

SESAMIN

Sesamin, which was available prior to the development of piperonyl butoxide, cannot be obtained as the extract (McKesson and Robbins holds the patents on its preparation) since it is sold only in combination with pyrethrins. John Powell & Co., Inc., is the only supplier handling the combination. Sesamin in combination with pyrethrins is of the same order of effectiveness against roaches as is piperonyl butoxide combinations, but it does not have as good knockdown on flies. Since a fairly high concentration of sesamin must be used with pyrethrins to give efficient results, when the cost of pyrethrins is high, sesamin combinations are cheaper than those of pyrethrins and some other synergist. Sesamin combinations are used in sprays as well as in aerosol bombs at the present time.

SYNERGISTS FOR ALLETHRIN

Two other synergists containing the methylenedioxyphenyl group, but prepared from the natural material isosafrole, are n-propyl isome (condensation product of n-propyl malcate with isosafrole) and Sulfox-cide (n-octyl sulfoxide of isosafrole), both products of S. B. Penick & Co. These have been developed at the Boyce Thompson Institute where many pipernyl compounds have been prepared and tested with pyrethrins.

While these materials are particularly valuable in enhancing the toxicity of pyrethrum in housefly sprays, the commercial availability of allethrin, the synthetic homolog of one of the four active principles of natural pyrethrum (*CI, May 1950, p. 716*), has aroused interest in their use with this new insecticide. Published work to date is insufficient to show accurately what effectiveness allethrin may have as compared to the naturally active elements in pyrethrum. However, control of flies and mosquitos by allethrin appears equal or slightly better, but the synthetic alone is inferior for control of roaches and some insects of agricultural importance. From preliminary observations, combinations of synergists with allethrin are not as effective as the combinations of the same synergists with pyrethrum. However, both n-propyl isome and Sulfoxcide increase allethrin's effectiveness against cockroaches, lack of which is a drawback in formulating household sprays and aerosols, and against flies.

It is still rather difficult to determine accurately the activity of allethrin, and consequently the effect of synergists upon it, because methods of analysis and standardization of the commercial material have not yet been completely worked out. Toxicological work to date has been sufficient to warrant U.S.D.A. approval for its use in aerosols, at least to the extent that 20,000 units of selected aerosol formulations will be permitted to be sold to test consumer acceptance of allethrin aerosols. It is permitted in sprays.

Penick sells a combination of allethrin and n-propyl isome under the trade name Allexcel, as well as the technical isome and technical Sulfoxcide alone. Isome combinations are being sold for flysprays but Sulfox-cide has not yet received approval for aerosols. Isome sells for $2.50 a pound, while the other is currently priced at $4.50 a pound. This latter material is about the same price-wise and of the same degree of effectiveness as are the Pyrenones.

Another synergist that has come to the fore with the advent of allethrin is "264", rights to which were recently purchased by McLaughlin, Gormley, King & Co., from Van Dyk & Co. This compound (n-octyl bicycloheptene dicarboxinide) also shows synergistic effect on both pyrethrum and rotenone, but this effect is more pronounced with allethrin, particularly with respect to knockdown and kill of roaches. In combination with allethrin and pyrethrins for roach control, its toxicity is

particularly evident, and it has some insecticidal value alone. Since lack of effectiveness against roaches has been one drawback to the use of allethrin in low-pressure aerosol bombs, there is some promise that 264 will help solve this problem.

The price of 264 at $1.65 per pound is considerably less than that of currently available materials. However, more of this compound than other synergists must be used to achieve comparable results. Despite this difference in quantity required for good effect, the cost differential is such that MGK claims use of this material represents an economy.

FUTURE PROSPECTS

Following the introduction of DDT and similar materials which emphasized residual insect control for the first time, there was a trend to use of just slight amounts of pyrethrins or similar quick knockdown materials in the space spray field. With development of resistant insects, use of pyrethrum-containing space sprays has increased greatly during the last year or two. Restrictions on the use of some synthetic insecticides around dairy barns has also accelerated this trend. There are some entomologists who actually feel that residual fly control is on the way out because of the problems associated with the materials that made it possible. Moreover, the current hearings of the Food and Drug Administration have served somewhat to put a damper on use of residual materials in household products, even though the hearings are concerned solely with the relation of chemicals to protection of crops.

It is reasonable to expect that military action again in the Pacific will increase requirements for natural pyrethrins. Price of pyrethrum flowers is now double the 1941 price and while supplies are greater than they have been for some years, demand far exceeds currently available supply. On the basis of present information, it is improbable that allethrin can be substituted entirely for natural pyrethrins. It is likely that combinations of the natural and the synthetic pyrethrin-like material, together with synergists, may offer a possibility of an immediate solution to the problems of raw materials for non-toxic and quick knockdown action needed against flying insects.

For the long run, development will continue on synergists both to expand further the utility of pyrethrum and to enhance the effectiveness of allethrin. Undoubtedly, synthesis of other pyrethrin-like materials will be accomplished, and they may need currently available and new synergists.

NEW SPECIALTY PRODUCTS

Note: This section limited to new finished specialties. New raw materials and intermediates of interest to specialties manufacturers are described in New Chemical Products department.

Multi-Color Finish (581A)

Marbleized effect is obtained in one coating.

A multi-color finish, which makes it possible to apply two or more colors in a single coat is now being marketed by United Lacquer Manufacturing Corp., 1001 W. Elizabeth Ave., Linden, N. J. The new enamel, called MultaColor, will sell at prices comparable to one-coat enamels. Its evenly-distributed colors produce a broken surface or marbleized effect.

It is available in 16 color combinations, but it may be prepared in an infinite variety of others. Some of the standard combinations are brown and white, green and white, etc.

MultaColor is time-saving and economical, claims United Lacquer, because it eliminates steps from standard finishing operations, such as undercoating, repeated spraying of each color, and sandings to smooth the grain raised by the paint or enamel. A primer coat is necessary only when the new enamel is used on metal.

The new enamel may be applied by the dip or spray technique, and is available in flat, semi-gloss, and gloss. MultaColor in bulk appears as a homogeneous mass of distinct specks of color. When sprayed or applied by the dip process, it appears marbleized.

Anti-Mildew Aerosol (581B)

Fabric and leather protection are provided in product for household and industrial use.

An aerosol preparation of an anti-mildew agent has been developed for household use. The product is being distributed under the trade name Formula J by the J. W. Johnson Co., Bellwood, Ill. Two types are available, one for fabrics, one for leathers. The chemical kills common molds that cause decay and stain and is not considered toxic to human beings. It is effective in preventing mildewing of clothing, leather goods and fabrics stored in damp places or used in humid climates.

Formulations of the new chemical are prepared by Scientific Oil Compounding Co., Inc., of Chicago. Active ingredient in this new liquid compound is Milmer 1, a mold killer manufactured by Monsanto Chemical Co., St. Louis.

Industrial formulations of the chemical, marketed as Cunilates, have been designed to factory-treat a range of products, including canvas, cordage, paper, plastics and surface coatings. The dressing for leathers, such as in shoes and luggage, is the more recent development. This treatment involves the addition of revitalizing oils to prevent brittling.

Metal Stripper (581C)

New stripper dissolves nickel, lead, tin, and chromium from copper base alloys.

Enthone Inc., 442 Elm St., New Haven, Conn. has developed a new product for rapid stripping of nickel, tin, lead and chromium from copper, brass and other copper alloys without attack upon the base metal. The process involves no current. The work to be stripped is immersed in an acid solution containing Metal Stripper N-165 and rapid removal of nickel and the other metals mentioned is accomplished. Stripping rates as high as 0.006″ per hour of nickel have been obtained, according to Enthone. The process is stated to be ideal for removal of nickel from bulk plated work as well as heavier plated objects, such as percolators, flashlights, plumbing goods and other items made of copper. It is also held suitable for rapid removal of nickel and chromium from tips of plating racks, thus reducing overall maintenance costs on plating racks.

The process is easy to use. One pound of Enthone Metal Stripper N-165 is added to each gallon of acid solution. Stripping can be done at room temperature or at higher temperatures if faster stripping is desired. The process is not suitable for removal of nickle from steel or zinc base alloys.

Enthone Metal Stripper N-165 is supplied as a neutral powder safe to handle and easy to use. Prices are from $1.50 per lb. in 5 lb. lots, to 85¢ per lb. for tons in 300 lb. drums, F.O.B. New Haven, Conn.

Multiwall Bag Adhesive (581D)

Ready-to-use seam adhesive machines cleanly, tacks quickly.

Poly-Lok, a new adhesive for fabricating multiwall and specialty bags from polyethylene-coated kraft stocks, has resulted in successful packaging for many products once bothersome or even impossible to handle, according to National Adhesives, 270 Madison Ave., New York 16.

Poly-Lok is a ready-to-use, cold resin seam adhesive that combines high solids with low viscosity. It machines cleanly on direct roller application, tacks immediately even at the rate of one hundred 10-pound

bags per minute, and dries to a transparent, light gray film unaffected by variations of temperatures or humidity, claims National. There is no air-blistering with age.

Poly-Lok adhesive seams are said to withstand hot calcium oxide at 250° F., food locker temperatures down to —20° F., and to protect food flavors, and keep hygroscopic products from coalescing. It is said to be non-flashing, practically odorless, and contains no fast-evaporating solvents; users find it is easily cleaned from glue pots with kerosene, toluene or naphtha.

Boiler Compound (582A)

Treatment eliminates foaming and boiler water carryover.

A new product, Concentrol, a treatment to eliminate foaming and boiler water carryover due to high alkalinity, dissolved solids, suspended solids or a combination of these factors, was recently developed by the Bird-Archer Co., 400 Madison Ave., New York 17.

Concentrol, which is essentially a surface active agent of the polyalkylene glycol group, functions by effecting a rapid change in surface tension of steam bubbles, thus permitting coalescence of small steam bubbles into bubbles of large size. The result is that unstable bubble films form and break readily upon reaching the steam disengaging surface of the boiler water, so as to eliminate building up of foam and subsequent boiler water carry-over, according to Bird-Archer. Concentrol is available in various formulations, depending on intended use. It may be safely fed through feedlines.

The amount of the product required to eliminate foam depends on nature of the feedwater and boiler concentrations. The company states that foaming has been eliminated in plants which have to carry as high as 12,000 ppm of dissolved solids and 7000 ppm of alkalinity.

Poultry Stimulant (582B)

Choline chloride solution has vitamin-like action.

Monsanto Chemical Co.'s Merrimac Division, Everett, Mass., is producing an improved, inhibited chemical for stimulating poultry growth. The 70% choline chloride solution contains an inhibitor to combat corrosion. A marked decrease in the corrosive action of choline chloride has been noted following addition of the inhibitor, Monsanto said.

While not classified as a vitamin, the new product has many of the properties of vitamins in preventing disease and accelerating growth. In tests the product has prevented perosis, improved feed efficiency in many rations and increased the rate of growth, depending upon formulas used, according to the company.

Inhibited choline chloride will be manufactured by Monsanto for distribution in tank car and drum lots.

Polystyrene Bond (582C)

Solvent combination bonds fast, has attractive storage features.

Rez-n-bond, a solvent combination which was originally developed for bonding acrylics, has now been modified for use in joining polystyrene to polystyrene.

The solvent combination is nonflammable, contains no acids, and may be safely handled with no precautions other than adequate ventilation. Shipment and storage is in ordinary tin cans and untreated steel drums. No thickening or deterioration results from prolonged storage, and an unlimited quantity may be stored without risk of fire, claims the manufacturer, Schwartz Chemical Co., Inc., 326 W. 70th St., New York 23.

Plastic objects cemented with Rez-n-bond set almost instantly. Jigs are necessary only in clamping poorly fitting seams or large sections, according to the company, and handling, buffing and other finishing operations may be carried out within an hour. Cemented joints in clear polystyrene and acrylics are claimed to be optically clear and free from bubbles. The resulting joint is as strong as the plastic itself and may not be separated without fracturing the surrounding plastic areas.

Paint Additive (582D)

Packaged additive makes paints mildew resistant.

Ad-It is the name of the packaged mildew inhibitor for paints which Nuodex Products Co., Inc., Elizabeth, N. J., has introduced to the paint trade. It is sold in one ounce and five ounce bottles, each individually packed. One ounce is sufficient for one gallon of paint; five, for a five gallon can. Nuodex imprints the name of the paint manufacturer on each bottle, since the product is being sold only through paint manufacturers for addition to paints on the job.

Nylon Emulsion (582E)

Treatment of nylon with nylon emulsion gives fabric silky feel.

An emulsion of Type 8 nylon and a method of applying it to textile nylon fiber to make it more comfortable has been developed by Hans C. Bick, Inc., manufacturing chemist and commercial fabric finisher. The finishing method, called "Nylonizing", makes the fabric moisture-absorbent, although it still dries as quickly as untreated nylon. Stockings, the only wearing apparel on which the new process has been tried so far, feel like silk after treatment. Public reception of the new stockings has been good, and the treatment may be used on other nylon articles of wear.

Case Hardener (582F)

New case hardening compound is fast-acting on both steel and cast iron.

Hard 'N 'Tuff is the trade name of a new fast-acting case hardening compound that is said to be effective on both steel and cast iron. Developed by Doughty Laboratories, 299 Madison Ave., New York 17, N. Y., it provides both a nitriding, chromizing and carburizing effect when applied to metal surfaces that are heated properly. Improvement in structural quality, hardness and wear resistance of metals is claimed. Doughty says that a soft 1020 carbon steel can be raised to a hardness of about 60 Rockwell C or about 600 Brinell.

Suggested applications are to high-speed drills, cutting edges and wearing surfaces of dies, molds, hammers, cams, etc.

Sealing Compound (582G)

Sealer for threaded joints and gaskets resists wide range of chemicals.

The plastic base of Leak Lock, as a new sealing compound introduced by the Highside Chemicals Co., 10 Colfax Ave., Clifton, N. J., is known, forms an elastic, rubbery film that resists a wide range of chemicals and solvents. Designed for threaded joints and gasket surfaces, it is claimed to set up three times faster than other products that do not become hard, thereby preventing liquids and gases from pushing through the seal before it has set up. Electrical properties of the new compound are such that it can be used as a sealer and insulator.

Leak Lock is available in nonclogging tubes and in cans.

Packaging Adhesives (582H)

Water-resistant adhesives meet military packaging specifications.

A new line of water-resistant adhesives has been developed by Paisley Products, Inc., 1776 Canalport Ave., Chicago 16, Ill., to meet joint U. S. Army and Navy packaging specifications for export packaging.

Four adhesives meet the requirements of JAN-P-101 specification covering sealing solid fibre V-board

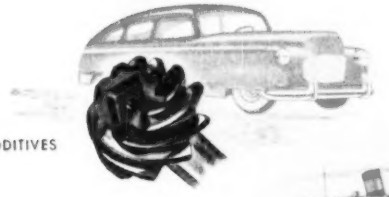
HIGHLY REACTIVE PHOSPHORUS CHLORIDES

another group of VERSATILE VICTOR CHEMICALS

Victor phosphorus chlorides are a highly reactive group of intermediates offering extensive applications and usefulness. Derivatives made from these important chlorides are used as:



- ⟶ PLASTICIZERS
- ⟶ SOLVENTS
- ⟶ OIL ADDITIVES
- ⟶ FIRE-RETARDANTS
- ⟶ PHARMACEUTICALS
- ⟶ ANTI-FOAMING AGENTS

Perhaps one of Victor's phosphorus chlorides will provide an improvement or more economy in the production of your product. Why not investigate the properties of this highly reactive group of chemicals? Typical reactions are given below:

$PCl_3 + 3ROH \longrightarrow 3RCl + H_3PO_3$
$PCl_5 + RCOOH \longrightarrow RCOCl + POCl_3 + HCl$
$POCl_3 + 3{=}COH \longrightarrow 3{=}CCl + H_3PO_4$
$POCl_3 + 3ROH \longrightarrow (RO)_3PO + 3HCl$
$PSCl_3 + 3ROH \longrightarrow (RO)_3PS + 3HCl$
$PCl_3 + 3ROH \longrightarrow (RO)_2POH + RCl$
$C_6H_5PCl_2 + 2ROH \longrightarrow C_6H_5P(OR)_2 + 2HCl$
$C_6H_5POCl_2 + 2ROH \longrightarrow C_6H_5PO(OR)_2 + 2HCl$
$C_6H_5PSCl_2 + 2ROH \longrightarrow C_6H_5PS(OR)_2 + 2HCl$

VICTOR CHEMICAL WORKS

141 WEST JACKSON BOULEVARD • CHICAGO 4, ILLINOIS

A. R. Maas Chemical Co., Division
4570 Ardine Street, South Gate, California

RECENT DEVELOPMENTS FROM THE A&S PACKAGING LABORATORY

Expendable Pallets—Palletized shipments of A&S bags lower your handling costs, minimize storage space.

STA-STAK Bag—Creped outer wall takes skid and slip out of stacking. Greater resiliency, easier handling.

SHUR-CLOSE—Ingenious bag valve assures less dust when packing—less sifting when packed—prevents waste.

PLASTO-PAK Bags—Polyethylene lined, moisture-proof protection for hygroscopic materials with exclusive "Electro-Seal" bottom closure.

SUPER GLOSS Flour Bag—Toughest of flour bags is bright white with brilliant inks to provide sparkling, appealing shelf packages.

ARK-TONE Printing—Sharp, clear color process combines perfect reproduction and brightness for consumer packages.

HI-TONE Printing—Strong, deep colors for sugar, salt, rice and similar bags.

PRESSUR-PAK Bale—Bags are packed under pressure. Saves 50% of customers' space allotted to storage.

C. P. WALKER, named chairman, Drug, Chemical & Allied Trades, N. Y. Board of Trade.

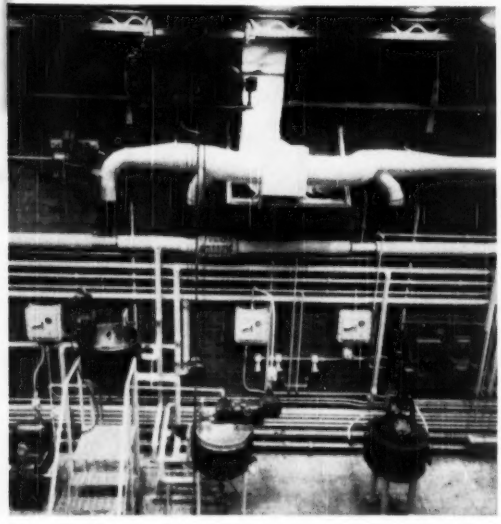
H. ALVIN SMITH, elected president of John Powell & Co. He was executive vice president.

R. L. FRANK, recently appointed director of research for the Edwal Laboratories, Inc.

LOOKING NORTH in the pilot plant. The mushroom pillars are typical of the Frank Lloyd Wright architecture used by S. C. Johnson.

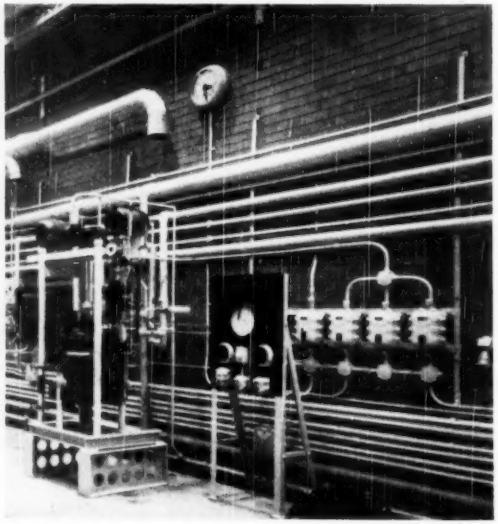
WAX PILOT PLANT

New pilot plant together with "research tower" gives S. C. Johnson & Son up-to-date wax development facilities.



A NEW pilot plant for the Experimental Engineering Department of the Research and Development Division, S. C. Johnson and Son, is now open for business. Modern equipment has been installed and arranged for equipment operation.

Piping for power and utilities is installed compactly along the west wall of the plant where the equipment is located. There are 16 separate electrical conduits and pipes for steam, natural gas, water, and a vacuum line.

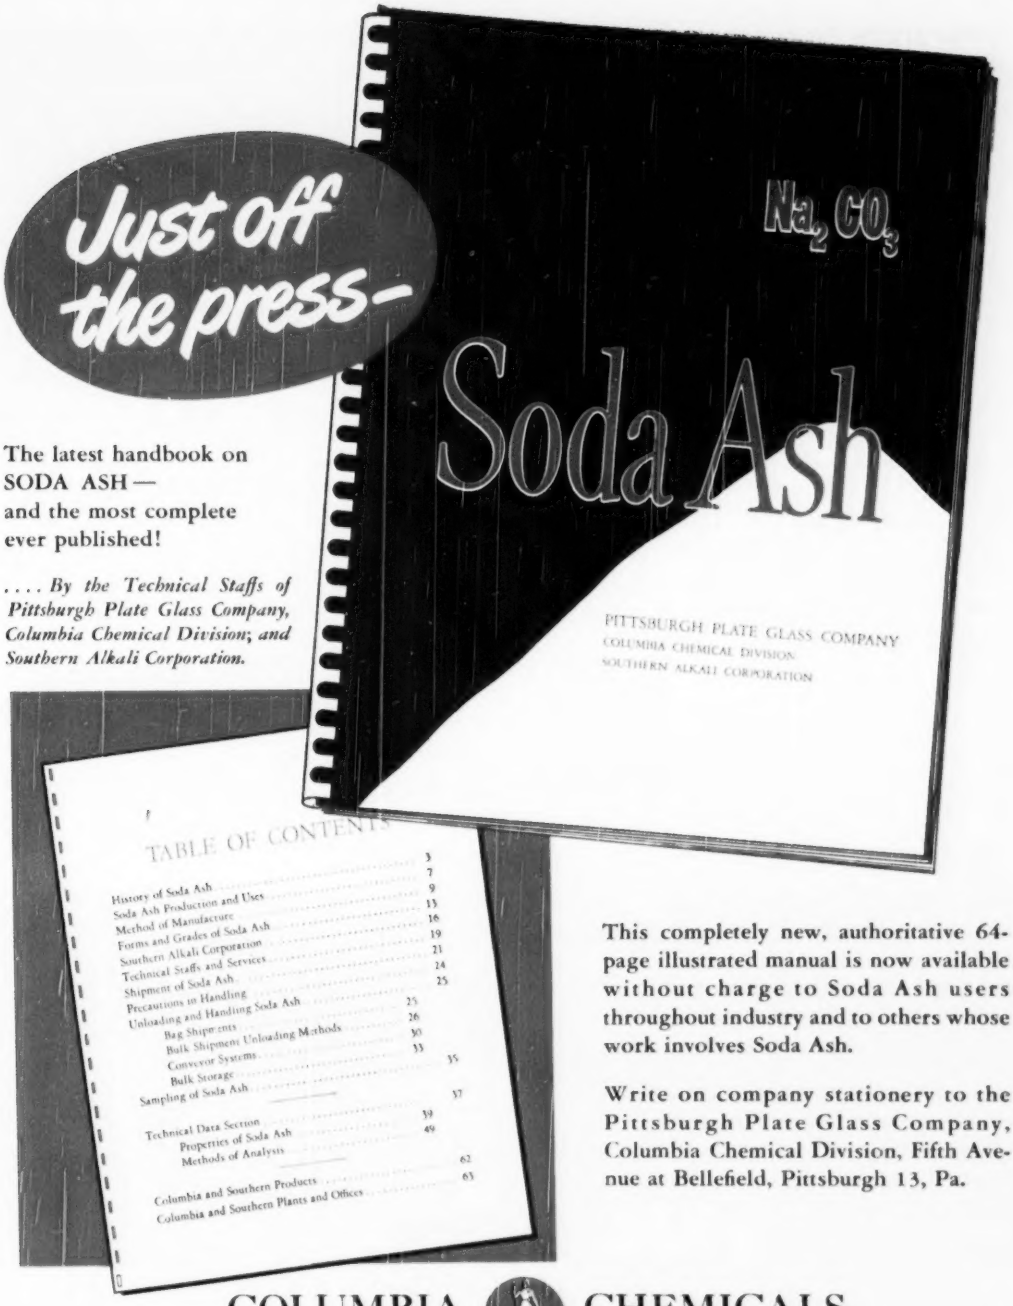


Overhead is a one-ton hoist which can be moved along tracks on the ceiling along the length of the building. The lift mechanism is electrically powered and operated by push button.

Other equipment includes a Blaw Knox resin pilot plant with a capacity of 15 gallons. There is also a stainless-steel 40 gal. mixing kettle.

A concrete draining channel 18 inches wide runs through the center of the floor. Waste liquids can be drained into this and rapidly run out of the building.

EXHAUST FAN near the roof will be fitted with flexible piping. Exhaust intakes can then be moved over equipment to draw out fumes.



EQUIPMENT at the plant is arranged for convenient operation. Construction on the building was started two and one half years ago.

Just off the press—

The latest handbook on SODA ASH — and the most complete ever published!

. . . . By the Technical Staffs of Pittsburgh Plate Glass Company, Columbia Chemical Division; and Southern Alkali Corporation.

This completely new, authoritative 64-page illustrated manual is now available without charge to Soda Ash users throughout industry and to others whose work involves Soda Ash.

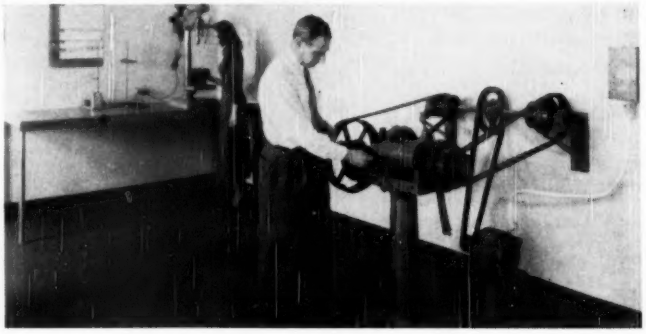
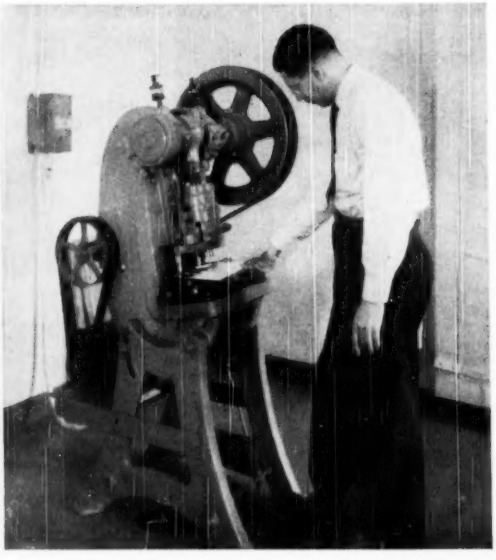
CONTAINER COATINGS



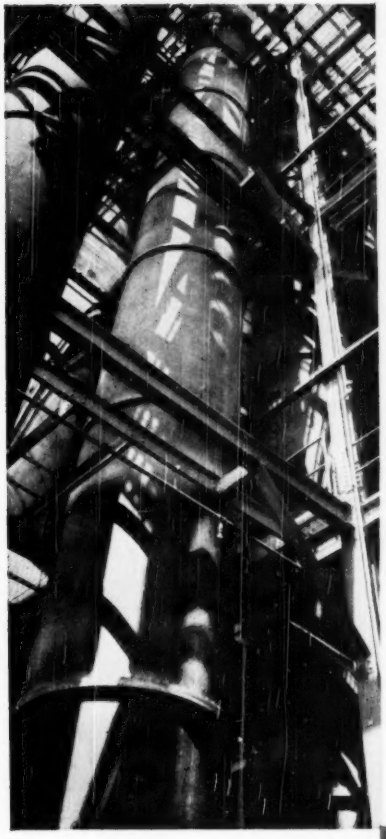
New laboratory develops and tests protective coatings for collapsible tubes and tinplate containers.

NEW research and development labs and a complete manufacturing plant have been put into operation by Surface Chemicals, Inc., at McKees Rocks, Pa. Surface chemicals specializes in the development and manufacture of protective coatings for collapsible tubes and tinplate containers for packaged creams, pastes, solvent liquids and other materials. The new unit has been established to better coordinate research and development activities with the actual manufacturing of protective coatings.

Pilot-plant equipment which duplicates the operations in a modern lithographic plant has been installed in the coatings laboratory. The facilities—which include coating machines, ovens, punch presses, and closure threaders—will permit coating tests under simulated production conditions. Other facilities in addition to the production plant include a physical testing lab, a chemical lab, machine shop and offices.



COATING is applied to tinplate to test its workability at Surface Chemcals' new lab.



CLOSURES made from coated tinplate are threaded to test flexibility of a coating.

TEST BATCHES and pigments and resins are dispersed and ground.

RUN OF SCREW-CAP blanks is fabricated on the punch-press.

SECTION of the chemical exposition, held at the Chicago Coliseum this September.

MANY SEE CHEM SHOW

THE 6th National Chemical Exposition held in Chicago this September attracted almost 25,000 visitors. About 140 companies—including several foreign firms—displayed the newest chemicals and chemical processing equipment.

The exposition is sponsored by the Chicago section of the American Chemical Society, and was held in conjunction with the 118th meeting of the ACS.

RADIATION from an engine part is checked with a Geiger counter at Atlantic Refining's labs.

ATOMS MEASURE WEAR

THE ATLANTIC Refining Co. has developed a method for using atomic energy in measuring the effect of different motor oils on the wear of automotive engines. In a short period of engine operation, the exact amount of radioactive iron particles which have been worn from an engine can be accurately determined, and the extent of damage calculated. This is done by measuring the radioactivity of the used oil which contains these particles. It is believed that the speed and accuracy of this test opens the door to great progress in motor oil research and development.

CH_3COOH

ACETIC ACID FROM TENNESSEE

We make it our business to know the needs of processors and manufacturers. By knowing your needs we can serve you better. We fit an integrated production, under rigid quality controls, to a "timed" delivery that offers you total dependability . . . supply-wise and quality-wise.

Let us become familiar with *your* specific needs. Then we'll demonstrate for you why particular buyers agree—it's wise to buy chemicals from Tennessee.

Tennessee can supply your complete requirements. For quotations and product information, write or call

de-spots rust stained textiles too

Pfizer Oxalic Acid does a superior job of removing rust stains from textiles and is easy to handle in the bargain. Pure, white, stable Pfizer Oxalic Acid is low in heavy metals, dissolves quickly, flows readily, will not cake on storage. These characteristics naturally make Pfizer Oxalic Acid similarly efficient as a textile, leather and wood bleach, mordant, laundry sour, catalyst, metal polish, electroplating chemical and chemical intermediate. Interested users are invited to write today for prices and samples.

SPECIALTIES NEWS

ASTM Organizes Committee On Wax Polishes

A new technical committee called Committee D-21 on Wax Polishes and Related Materials has been organized by the American Society for Testing Materials. Its function will be to develop standard test methods and definitions of terms and to promulgate standard specifications for these materials.

Initially the committee will concentrate its work on standardizing test methods and procedures for evaluating various properties of the materials and also study nomenclature and definitions of terms. Water-emulsion type waxes will probably receive first consideration in the development of test methods. Automobile, furniture and other type waxes will be included later in the work.

The committee will have competent technical representation from leading consumers, producers and general interest groups.

Urges Filing Briefs for Residue Hearings

The importance of filing industry briefs as a contribution to the establishment of sound residue tolerances for agricultural chemicals used on fresh fruits and vegetables was stressed last month at the seventeenth annual meeting of the National Agricultural Chemicals Association by John D. Conner, NAC counsel. Proposed tolerances may be announced by the administrator of the residue tolerance hearings in time to guide state officials in making their 1951 recommendations.

Mr. Conner pointed out that the administrator has wide discretion in setting proposed tolerances, and that it is industry's job to assist him through briefs in arriving at regulations that will permit prudent use of the industry's products without undue restriction upon the farmer and with complete assurance of safety to the consumer.

Lab Tests Upheld for Laundry Detergents

Use conditions need not be simulated in conducting laboratory performance tests for laundry detergents, as is popularly believed, according to T. H. Vaughn and H. R. Suter of Wyandotte Chemicals Corp. They state that close simulation is neither practicable nor necessary in such investigations, for laboratory results have so closely correlated with field results in commercial laundries that attempted simulation has been disregarded in favor of more important factors.

Both experimental investigator and detergent manufacturer find separate tests measuring soil removal and whiteness retention properties most useful. Soiling artificially with carbon black from an aqueous medium is advantageous with respect to reproducibility in tenacity and in variation and susceptibility to removal by detergents having different degrees of effectiveness. Several years research show the precision of soil removal tests to be approximately ±3.4% in terms of mean deviation and the whiteness retention tests to be approximately ±5.1%.

N.Y.C. Revises Flammable Labeling Requirements

Manufacturers offering for sale in New York City products that require a caution statement because of the flammable nature of their composition should be aware of the revised caution statement regulation of the city's fire department. The caution statement must be of the same size and not smaller than the largest type used on the label except that of the name of the product. The fire department is now actively enforcing compliance with the strict letter of this regulation, and thus far has refused to modify the regulation as requested by manufacturers who claim that it forces expensive revision of present labels, recall of products from retail outlets, typographical oddities and deletion of necessary directions, and is in conflict with other statutory requirements.

Du Pont Expands BHC Capacity

Work is now in progress by the Du Pont Co. on a large increase in its capacity for benzene hexachloride, the insecticide used in cotton pest control. Previously the company's BHC capacity had been raised by more than 9 million pounds per year over design capacity of its plant when it went into operation early in 1949. This earlier increase was made possible by engineering changes and improvements in processing techniques.

Du Pont sells its production under the trade name Lexone in bulk to dust mixers, and in Du Pont Cotton Dust No. 10, which also contains DDT and sulfur.

Sherman W. Putnam (left), named Midwest general sales manager for the Ultra Chemical Works, Inc.; and William M. Shine, who has joined the Plastics Department of Arnold, Hoffman and Co., Inc. Mr. Shine was formerly associated with General Aniline and Film Corp.

New Fertilizer Planned by International Minerals

International Minerals & Chemicals Corp. has completed negotiations for purchase of a site in Fort Worth, Tex. from Consolidated Chemical Industries, Inc., and will build a new chemical fertilizer plant. Consisting of about thirty acres, the site is adjacent to the plant of Consolidated Chemical, which will be the source of sulfuric acid used in International's superphosphate manufactured at that location.

The plant will have a capacity of 40,000 tons per year, will cost about $5 million. Products in addition to superphosphate, will include mixed fertilizers. Construction is expected to start soon.

New Paint Co. Formed

Dudley B. Blake, former general sales manager of United Lacquer Manufacturing Corp., has formed Blake Paint Corp. Offices are at 103 East 125th St., New York, N. Y.

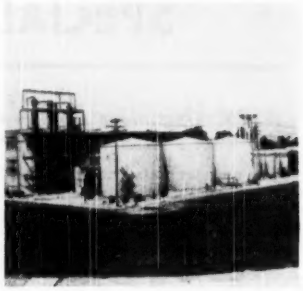
company will also sell a full line of house paints under the trade name Blake on a national basis to distributors and dealers.

Corrosion Data Given on Soap Plant Equipment

Operators of soap and fatty acid plants will be interested in a summary of results of corrosion tests of operating equipment used in such production. These data were contained in a paper presented by J. F. Mason, Jr. and Wayne Z. Friend before the Fifth Annual Conference of the National Association of Corrosion Engineers and printed in booklet form by The International Nickel Co., Inc., 67 Wall St., New York 5, N. Y., from which it may be obtained without charge.

Tests in the boiled soap process and glycerin recovery include those in soap kettles, caustic storage, brine tanks, acid and alkali treatment and filtering of soap lye, salt-glycerine slurry, salt-glycerine evaporators and glycerine stills, glycerine bleaching and storage.

Tests in fatty acid processing include those in Twitchell and high temperature water splitting of fats, acid washing of fats and fatty acids, deodorization, heating and distillation of animal and vegetable fatty acids including tall oil, fatty acid storage.



Pest Control Convention

The National Pest Control Association, Inc., which is holding its eighteenth annual convention at the Netherland Plaza Hotel, Cincinnati, October 23-25, 1950, has completed the program for the meeting. In addition to meetings of various technical and business committees, there will be papers on lindane, new developments and techniques in rodent control, fly control in 1950, the safe use of insecticides, the Food and Drug Administration's relationship with the pest control operator and the food manufacturer, and mothproofing problems.

SKF Adds Million-Dollar Wing

A new $1.2 million-wing will be added to the present Philadelphia building of Smith, Kline & French Laboratories. Scheduled for completion late next spring, it will consist of four floors and a basement to be used for office and warehouse space.

In addition to this planned construction, a $150,000 expansion of research laboratory facilities in SKF's present building has just been completed.

Trichlorethylene plant at Ashtabula, O. just completed by Hooker-Detrex Inc. Its production will be used in manufacture of metal degreasing solvents for the Detrex Corp., Detroit.

Abbott Labs Building Laboratory Addition

Abbott Laboratories has started construction on a $283,000 addition to the Development Laboratory building at its North Chicago plant. It is expected to be ready for occupancy early next year, and will more than double size of the existing one-story building.

Included in the project is a section housing three stories of development laboratories for chemical engineering, antibiotics and biochemistry, a conference room and offices. The east half of this section, divided into two stories, will be devoted to a large operations area where heavy equipment used in developing manufacturing processes will be located.

A partial second floor addition above the present building will accommodate still other laboratory and conference facilities.

Solvents in Nitrocellulose Formulations

Celanese Corp. of America has just published a revised Bulletin E-1-2, which contains details on performance studies of its Solvents 203 and 601 in nitrocellulose formulations. These tests show that these solvents in both lacquer and thinner make possible use of higher solids, without sacrifice of blush resistance, drying time, or other properties and with a substantial saving in solvent costs, the company reports.

Caution Urged in Use Of Newer Insecticides

Extreme caution in using newer insecticides containing HETP, TEPP and parathion has been advised by a group of private and governmental physicians and research men who are members of or consul-

A new approach to quantity production of a variety of chemical products through use of

Oronite Xylene Isomers

Ortho and Para Xylene Isomers now available in quantity

These materials represent a commercially new and attractive group of chemical intermediates from which a wide variety of products can be synthesized.

Through use of these new raw materials you may find a simpler, more economical method of production. Xylene derivatives which formerly required difficult isomer separations may now be produced readily and in high purity from the desired Oronite Xylene Isomers.

Ortho Xylene 90%

Available in drums and tank cars. (Specified purity, 88% minimum.) A raw material for the production of phthalic anhydride, aromatic aldehydes and acids, xylenols, resins and intermediates for polyesters and polyamides, dyestuffs, lacquers, plasticizers, etc.

Para Xylene 95%

Available in drums and tank cars. (Specified purity, 95% minimum.) A desirable raw material for producing terephthalic acid, 2, 5-xylenol, *p*-toluic acid, and intermediates for polyesters, polyamides, alkyd resins, dyes, insecticides, pharmaceuticals and many other products.

META XYLENE 95%

Available in pilot plant quantities only

Specified purity, 95% minimum. Suggested for manufacturing monobasic and dibasic aromatic acids, resins, dyestuffs, pharmaceuticals and perfume ingredients.

Get your copy of "Xylene Technical Review"

A review of published literature on Xylene Isomers and many tables of practical applications. Includes an extensive bibliography. Write for your copy now. Also, ask for free sample of Oronite Xylene Isomers (please specify type and prospective use).

Some Other Oronite Products:

Polybutenes *Cresylic Acids* *Naphthenic Acids*

tants to the American Medical Association's Committee on Pesticides. These materials are used principally for control of aphids, mites and other fruit and vegetable crop insects, and not for insects attacking man or animals or for insects in households and storage rooms.

Although authenticated cases of poisoning reported total 198 to date, it was pointed out by U. S. Department of Agriculture representatives that it is quite unlikely that a parathion spray residue problem will become serious if spray schedules recommended by qualified entomologists are followed. This is particularly significant since parathion, of the three chemicals mentioned, has the greatest stability in water and greatest solubility in fatty mediums, including the outer layer of fruit and leaves.

The following measures to reduce exposure and minimize absorption of the insecticides were recommended in a recent Journal of the American Medical Association:

1. Clean protective clothing is required.

2. Workmen engaged in manufacture or packaging of the chemicals should have adequate exhaust ventilation. People applying aerosols of the chemicals, including pilots, should wear face masks. Wind dispersal should be avoided to unprotected people or animals.

3. Personnel should remove protective clothing and wash hands, arms and face thoroughly with soap and water before eating, drinking or smoking.

4. Flammable insecticide containers should be burned and any area in which insecticides are spilled should be decontaminated by cleaning and washing. Waste should be burned or buried.

5. A periodic blood test helps to prevent cumulative effects in exposed personnel by indicating those who should be removed from exposure.

This report in the AMA journal is in line with the program of the Committee on Pesticides to interpret studies made on the toxicity of agricultural chemicals, and publish them in the society's publications at periodic intervals.

Aldrin Accepted for Grasshopper Control

The U. S. Department of Agriculture has accepted aldrin for control of grasshoppers subject to the following understandings and limitations:

1. Dosages of 2 oz. of aldrin per acre in the emulsifiable form and 3 oz. per acre in the dust form will be accepted.

2. For control of grasshoppers on fiber crops such as flax and cotton; on cereal crops such as wheat and barley; on forage crops such as clover and alfalfa and on range and waste lands.

3. Aldrin formulations should not be applied on pastures, range lands or crops that are to be used to pasture or feed dairy animals or animals being fattened for slaughter.

4. Pasture or crops treated with aldrin insecticides should not be fed to animals until 21 days following application.

5. Aldrin insecticides should not be applied to crops intended for human consumption.

Rohm & Haas Buys Experimental Farm

Rohm & Haas has purchased a 211-acre farm in Bucks County, Pa., for extension of its experimental field research on agricultural chemicals. Parts of the farm, located about nine miles from the company's Bristol plant, have been in possession of the company since 1928, and it has been used as a proving ground for agricultural insecticides and fungicides since the early 'thirties.

A factor in selecting this particular farm was the suitability of the

ISCO

SHORT and to the point, we're a group of chemical specialists who back up our chemicals, gums and waxes with a kind of service we call ISCOoperation.

You may rightly ask what is ISCOoperation? Briefly, it's a unique type of trade cooperation that goes beyond the mere selling and delivering of quality products. If you have a production problem, our "trouble-shooters" with an average of 15 years practical chemical experience will go to work for you. These men know *their* business and are willing to roll up their sleeves to determine *your* special requirements.

You'll enjoy doing business with ISCO representatives because they are down-to-earth, practical chemical salesmen.

soil to fruit trees as well as to vegetable crops, since some of the company's principal development is concerned with insecticides for fruit pest control.

Brazilian Farmers Want U. S. Insecticides

Brazilian manufacturers of insecticides and fertilizers cannot compete with foreign producers either in quantity, quality or price and continued import restrictions covering these items will severely damage Brazilian agricultural production. This was the statement of Francisco Malta Cardoso, president of the Brazilian Rural Society (Sociedade Rural Brasileira) after complaining to the Export-Import Department of the Banco de Brasil against its severe policies.

Company Notes

• **Laboratory and research facilities** of Arner Co., Buffalo, N. Y., are being expanded 50 per cent to keep pace with increased business. A third floor is also being added to the existing two-story building at its Fort Erie, Ont., plant.

• **Executive offices** of Sterling Drug, Inc., have been moved to 1450 Broadway, New York, where its New York operations will now be consolidated. Previously the offices were at 170 Varick St.

• **A contract** of undisclosed amount for a fertilizer plant and office building to be built in central New York State has been awarded by F. S. Royster Guano Co., Norfolk, Va., to McCloskey Co., Pittsburgh.

• **Sales in Canada** of Rohm & Haas pectic enzymes for clarifying fruit juices and wines will now be handled through its Canadian affiliate, Rohm & Haas Co. of Canada, Ltd.

• **Work on Lever House,** new 21-story headquarters of Lever Brothers Co. at 390 Park Ave., New York, N. Y., will begin immediately. The company has just awarded the construction contract to George A. Fuller Co., New York City.

• **Hercules Powder Co.** reports that a new finishing technique, the hot-lacquer process, is attracting widespread interest in the finishes field not only because of the economies it offers to the finishing industry but also because it offers that industry a means of by-passing the shortage of volatile ingredients. In this process, heat instead of volatile solvents, makes the lacquer thin enough to spray.

NEW TRADEMARKS

From Official Gazette—Vol. 635, No. 1.

G-11. Substance having the chemical formula, 2,2'-dihydroxy-3,5,6-3',5',6'-hexachloro diphenyl methane and being suitable as active ingredient in bactericidal preparations, such as soap, shaving cream, ointments, and the like. 550,749. Sindar Corp.

VIDEO-WHITE. Bleaching and washing solution having disinfectant and deodorizing properties. 567,244. Felice Products Co.

HENGAR. Chemical boiling solutions to prevent bumping, being used as laboratory reagents. 567,784. Hengar Co.

(Symbol). Upholstery tint and dye solution, hydraulic brake fluid and anti-freeze solution for radiators of internal combustion engines. 570,119. Packard Motor Car Co.

PYRAY. Fluorescent dye. 578,317. Colgate-Palmolive-Peet Co.

F-218. Octafluoropropane, being fluorinated hydrocarbons used as refrigerants, propellants, and fire extinguishing preparations. 583,349. Kinetic Chemicals, Inc.

LTPEX. Carbon black for use in the rubber industry. 584,268. Columbian Carbon Co.

VITAMURE. Plant manures and fertilizers. 538,841. Alexander Products Ltd.

WHITE HOUSE. Plant and lawn foods, and garden fertilizers. 553,180. Cussins and Fearn Co.

ROSETONE. Plant stimulant. 573,223. American Chemical Paint Co.

SASCO PHOS. Fertilizers. 576,143. Mathieson Chemical Corp.

AIR-IN. Additive and curing agents for use in cementitious compositions and concrete. 580,365. Hunt Process Co.

PERMA-DRI. Compositions of a cementitious nature, containing siliceous particles, used for weather-proofing, insulation acoustical treatment, or as a moisture condensation and fire retardant. 595,293. Stephenson Air Brush Paint Co.

ELI WEATHERBY'S. Various paints and paint materials. 550,493. Davis Paint Co.

TWICE-A-YEAR. Laundry starch. 525,823. National Textile & Chemical Lab.

INDUSTRIAL FLOOR-DRY No. 85. Granular siliceous material for application to floors for absorbing oil, water, and other liquids. 525,825. Eagle-Picher Co.

NU-ERTH. Plant food and tonic. 535,830. Wisconsin Angler Farm.

Spessard's "MIRACLE GARDEN" Hydroponic Plant Food Formula 10. Hydroponic chemical plant food. 525,832. Hydroponics, Inc.

KELTROL. Drying oils for use in paints, varnishes, lacquers, and enamels. 554,983. Spencer Kellogg and Sons, Inc.

Stevens'. Ready-mixed paints and paste paints for brick and concrete surfaces. 567,526. John McGuade & Co., Inc.

UNDERPHENO. Resinous plastic protective coating composition for use on masonry surfaces, painted and varnished surfaces, and other similar type surfaces. 578,408. Phenoplast Corp.

CYKELSOY. Drying oil for use in paints, varnishes, lacquers, and enamels. 580,245. Spencer Kellogg and Sons, Inc.

MIRRO-GLAZE. Cleaner for automobile bodies and fenders which restores the finish. 564,576. Lustre Products Corp.

(Symbol) Cleaner for gold, silver, jewelry, brass, copper, windows, and chromium on autos. 567,267. A. Miranda and Co.

TUMBLE SUDS. Soap powder. 572,299. Economics Lab., Inc.

LI-QUAT. Cleansing and sanitizing preparation containing a quaternary ammonium compound as an active ingredient for cleansing and sanitizing milking machines, milk equipment, diary equipment, food containers and utensils, and eating utensils. 573,887. Milk Plant Specialties Corp.

From Official Gazette—Vol. 635, No. 2.

Asph-O-Lite. Synthetic resin coating preparation for sealing asphalt tile surfaces. 500,363 Carsolite Corp.

DARI-GLO. Ready-mixed paint. 515,556. Berkshire Paint Co.

"DUST-PROOF". For floor and furniture oil and polish. 526,804. Norman C. Hayner Co.

(Symbol) For floor wax in liquid, paste, and powdered form. 541,358. U. S. Sanitary Specialties Corp.

Davis. For automobile polish, cleaner, combination polish and cleaner. 548,032. Western Auto Supply Co.

Childsco. Oil, liquid wax, paste wax polish for automobiles, floors and furniture. 562,322. Childsco. Products Co.

FORMAX THE FOUR McALEERS. Polishing compounds namely, hand and machine, sanding, polishing and buffing compounds. 563,548. Formax Mfg. Corp.

NEW TRADEMARKS——

B A & Co. For cleaning preparations for textiles and the like, cleaning and polishing preparations, polishing cloths, shoe polish, polish removers, leather treating oil, leather softener and toilet articles. 570,153. B. Altman & Co.

WALL ART. For interior wall paint ready for use. 527,601. Minnesota Paints Inc.

VITROLENE. For wood floor sealer and finish ready for use. 527,961. Minnesota Paints Inc.

GILMAN. For exterior and interior paints and varnishes. 535,413. Gilman Paint and Varnish Co.

DIM-TONE. For ready-mixed liquid paints primarily intended for wall finishing. 535,565. J. F. Kurfees Paint Co.

WOW. Enamels and ready-mixed white paints particularly suitable for interior flat wall finish. 541,455. Republic Paint & Varnish Co.

VANITY. For 4-hour drying enamel semi-gloss paint particularly suitable for interior walls. 541,461. Republic Paint & Varnish Co.

EVRY-USE. For varnish. 556,063. Armstrong Paint & Varnish Works.

RH. Synthetic resinous materials or solutions or emulsions thereof primarily for protective or decorative coatings plasticizers for lacquer, enamel, paint, and similar coating compositions. 574,737. Rohm & Haas Co.

PENTALUX. Paints intended generally for household decoration, varnishes. 581,263. Imperial Chemical Industries, Ltd.

DWSS. For plastic coating with metallic ingredient for repairing and sealing metal and wood surfaces and protecting against rust and decay. 581,523. DWSS Co., Inc.

ZONETEX. Street marking paint. 583,871. Great Lakes Varnish Works, Inc.

From Official Gazette—Vol. 635, No. 3

PENTA PRESERVATIVE. Chemical solution for preserving lumber and wood. 515,935. Chapman Chemical Co.

INDRAIC ACID. For mixture of petroleum wax and resin, for general use in industry as a hardener for other waxes. 552,979. Industrial Raw Materials Corp.

NEF LAC COMPOUND A PRODUCT OF J. W. NEFF LABORATORIES INC. For slabs of thermoplastic material for pressing into phonograph records. 554,999. J. W. Neff Labs., Inc.

MASTER GLOW. For liquid floor polish. 550,461. Tru Cote Mfg. Co.

BULL-DOG. Gummed paper tape and gummed cloth tape. 534,414. Chicago Gum Tape Co.

AERO-KLENZ Preparation for use as a deodorant particularly to deodorize air in rooms. 552,629. W. F. Anderson, Inc.

JOHNSON'S ANT KILLER M. H. Johnson. Insecticide. 556,799. J. A. K. Co., Inc.

EXTELITE. Synthetic resin compositions and synthetic resin composition extenders. 558,982. Agicide Labs., Inc.

Magnesol. Silicious purifying and decolorizing material and absorbents namely, synthetic magnesium silicates. 563,958. Food Machinery and Chemical Corp.

LINAGRAPH. For photographic chemicals. 566,509. Eastman Kodak Co.

BRASCO. Insecticides and rodenticides. 567,677. Bradford Mfg. Co.

CINCH Anti-slip preparation for application to hands or implement used in sports, industry, and like. 569,668. Chem Products, Inc.

NORTH STAR. Anti-freeze preparations. 569,860. Kansas Labs., Inc.

Emergency FIREMAN. Comminuted free-flowing, fire-extinguishing dry chemical. 570,080. Ansul Chemical Co.

NEOTRAN. Parasiticide useful principally as acaracide. 570,407. Dow Chemical Co.

LASTA. Compositions for starching textiles and apparel. 572,970. Gordon Chemical Co., Inc.

DUBLE-POWER. Chemicals in powder form to be inserted into the cells of storage batteries containing sulphuric acid for preventing and deterring sulfation on the lead plates and for lowering the freezing point of the acid. 574,221. Duble-Power Chemical Co.

MONOFAST. Pigment colors for textile printing, plastic compounds, and rubber compounds. 574,365. H. Kohnstamm & Co., Inc.

ANTAPHOR. Anti-foaming agent. 574,559. Cita Ltd.

AMMORID. Rinsing composition. 575,063. Kinney and Co.

HOOKER LYCONS. Lye in hand size containers. 576,392. B. T. Babbitt, Inc.

BUFEN-1. Bactericide containing phenylmercuric acetate. 576,503. Buckman Labs., Inc.

HOOKER. Caustic soda, other than lye in hand size containers. 576,832. Hooker Electrochemical Co.

SOLVACOL. Alcoholic solvents. 578,118. Commercial Solvents Corp.

MOTHALENE. Naphthalene and paradichlorobenzene insecticides and deodorants. 578,269. Koppers Co., Inc.

STEROZOL. Germicidal and preservative compositions. 578,654. Wallerstein Co., Inc.

Dimite. Insecticide and miticide. 580,207. Sherwin-Williams Co.

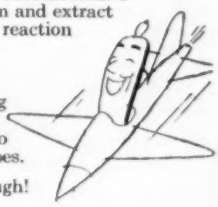
Amazing Ammonia

applies for a job!

If ammonia, the versatile chemical, applied for a job, the interview would probably go like this:

EMPLOYER: How old are you?

AMMONIA: Many centuries. I helped the ancient Egyptians bleach cloth 3,000 years ago.



EMPLOYER: Amazing! But what do you do today?

AMMONIA: I grow farm crops, make ice, purify water, produce explosives.

EMPLOYER: I know you are a fertilizer, a refrigerant, and . . .

AMMONIA: Yes, and I serve as a protective atmosphere to surface-harden and anneal vital parts of planes and automobiles. I neutralize acid in petroleum and extract metals from ores. I'm a solvent and reaction medium in organic synthesis, a nutrient for yeast and a processing agent in the manufacture of alkalis, rayon, dyes, butadiene, and catalysts for cracking petroleum. I'm used in making vitamins, sulfa-drugs and radio and television parts and tubes.

EMPLOYER: Whoa—that's enough! What can you do for us?

AMMONIA: Just let a Barrett technical man talk it over with your chemists. He can usually find an answer that will speed up some process and save you dollars.

MAIL COUPON BELOW

The BETTER the ODOR the BIGGER the SALES!

...AND THE ODOR IS GONE!

The perfume chemist's skill in masking unpleasant odors, as applied to insecticide and disinfectant sprays has doubled and redoubled the spray maker's market by making these products pleasingly acceptable for household use . . . It might pay you to ponder the possibilities of using this same skill in the manufacture and merchandising of your company's products. But better still, mail the coupon and let us *show* you how.

Wonderful way to feel!

You certainly can be on top of the world!

Why not? Your car is paid for and your house is halfway there. You're making pretty good money . . . the kids are healthy and happy . . . and your wife just bought a new outfit—shoes to chapeau!

You don't owe anybody a red cent. Not only that—you've got a little money salted away for the kids' education and your own retirement.

Wonderful way to feel, isn't it?

If this description doesn't fit you—*make it!* You can.

Here's how . . .

Start saving right now! Just as much as you possibly can—*and regularly!*

One of the best ways . . . one of the safest, surest ways . . . is to buy U. S. Savings Bonds through the Automatic Payroll Savings Plan where you work. Or, arrange to purchase Bonds regularly at your post office or bank.

U. S. Savings Bonds will bring you, in ten years, $4 for every $3 you've invested. And you can count on that!

Start your plan today. It's the very wisest way to save!

Automatic Saving is Sure Saving — U.S. Savings Bonds

Contributed by this magazine in cooperation with the Magazine Publishers of America as a public service.

CHECK THE PROPERTIES OF THESE CASTOR OIL DERIVED fatty acids

Alkyd Compounding

Both acids are characterized by high degree of chemical reactivity and strong resistance to after-yellowing. 9-11 Acids alkyds provide excellent gloss, adhesion, and durability. Try it for up-grading soya fatty acids.

Plasticizing

P-10 is strongly recommended as a most efficient and economical plasticizer for allyl starch and Zein.

TYPE →	DRYING	NON-DRYING
TRADE NAME	9-11 ACIDS	P-10
CHEMICAL NATURE	9-11 LINOLEIC	RICINOLEIC
MOLECULAR WEIGHT	281	296
COLOR (G-H)	2+	10
NEUTRALIZATION VALUE	193	180
IODINE (WIJS)	150	89

Consult our Technical Service Department for further information

APPLICATIONS

9-11 ACIDS — Alkyds, driers, in-situ varnishes, epicholohydrin bis-phenol resin reactions.

P-10 — Alkyds, cosmetics, soaps, grease making, pharmaceuticals, emulsifying agent, plasticizer for allyl starch and Zein.

ESTABLISHED 1857

THE baker CASTOR OIL COMPANY

LOS ANGELES 120 BROADWAY, NEW YORK 5, N. Y. CHICAGO

NEW CHEMICAL PRODUCTS

Tricarboxylic Acid (602A)

Carboxymethylmercaptosuccinic acid is available in pilot-plant quantities.

An interesting intermediate that combines a thioether linkage with three carboxylic acid groups is available in pilot-plant lots from Evans Chemetics, Inc., 250 E. 43rd St., New York 17, N. Y.

The compound is a white powder melting at 136-138 C., very soluble in water and alcohol. Minimum purity of the material is 98%.

Suggested uses include synthesis of alkyd-type resins, plasticizers, surface-active agents, oil additives, pharmaceuticals, dyestuffs, rubber chemicals, stabilizers, and insecticides. Current prices range from $2.00 to $1.15 per lb., depending on quantity. Samples are available on request.

Plasticizers (602B)

New series of plasticizers are primary for cellulosics, secondary for polyvinyl chloride.

Seven new plasticizers introduced by Atlas Powder Co., Industrial Chemicals Dept., Wilmington 99, Del., are designed as primary plasticizers for nitrocellulose, cellulose acetate-butyrate and similar cellulosic polymers. At the same time, however, they are useful secondary plasticizers for polyvinyl chloride compositions.

Designated Pycal plasticizers, these materials are reported to be monomeric ester-type compounds. One is a solid, the sharp melting point of which is of advantage in the preparation of specialty heat-sensitive formulations; e.g., adhesives. One is a viscous liquid, and the other five are mobile liquids. One is of particular interest because of its low cost, and its use up to 25% in vinyl formulations, where it replaces more expensive plasticizers, permits material economies.

Data sheets describing these plasticizers are available from the manufacturer.

Di-t-butyl Peroxide (602C)

Polymerization catalyst and intermediate now in commercial manufacture.

Di-t-butyl peroxide is now made in commercial quantities by Lucidol Division, Novadel-Agene Corp., 1740 Military Road, Buffalo 5, New York.

The new product is an unusually stable organic peroxide with a high temperature of decomposition. It is an excellent source of free radicals and as such finds use as a raw material in organic syntheses and as a polymerization catalyst, particularly at temperatures above 100° C. The commercial product assays 97.0% (min.) which is equivalent to an active oxygen content of 10.6% (min.).

Shipment is made as an inflammable liquid (Red Label) in amber glass bottles, 1 lb. and 6 lb. net, and in ICC-17E steel drums, 30 lb. (5 gal.), and 98 lb. (15 gal.) net.

Technical data, price quotations and samples are available on request.

Vinyl Plasticizer (602D)

High-molecular-weight monomeric plasticizer possesses many advantages of polymerics.

Staflex KA is a new ester-type plasticizer offered to vinyl plasticizers by Deecy Products Co., 120 Potter St., Cambridge 42, Mass.

The new material is designed to incorporate some of the advantages possessed by polymeric plasticizers without the disadvantages of those materials. Staflex KA is a liquid with a somewhat higher viscosity than dioctyl phthalate but easily dispensed from drums and dry-mixed with resin. Stocks based on Staflex KA process easily; i.e., they show rapid resin dispersion and excellent plasticity on the mill or calender.

Because of a higher-than-usual molecular weight, the new plasticizer has migration rates considerably lower than those of common primary plasticizers. At room temperature loss by migration of Staflex KA is close to that of the polymerics.

A data sheet describing further advantages and presenting technical data is available from the manufacturer.

Hydrogen Bromide (602E)

Westvaco now making hydrogen bromide on commercial basis.

Hydrogen bromide, anhydrous, a new product of Westvaco Chemical Division's research and development, is now a standard commercial item.

A new price schedule, effective immediately is as follows:

35 lb. net cylinders	75¢ per lb.
100 lb. net cylinders	
Lots of less than 1500 lbs.	60¢ per lb.
Lots of 1500 lbs. or more	55¢ per lb.

These prices are f.o.b. South Charleston, West Va., but rail and motor freight equalized with Midland, Mich.

Continued process improvements and increased use in the pharmaceutical and organic chemical fields have made these developments possible.

N-Methyltaurine (602F)

Useful intermediate available in experimental quantities.

N-Methyltaurine, a versatile intermediate for detergents, dyestuffs, pharmaceuticals and many other organic chemicals, is now available to industry in experimental quantities from the Industrial Chemicals Department, Antara Products, General Aniline & Film Corp., 435 Hudson Street, New York 14, N. Y.

Long a "captive" intermediate manufactured solely for General Aniline use, N-methyltaurine is sold to industry in the form of an aqueous solution of its sodium salt. It is a valuable, low-cost intermediate with many interesting potentialities. Other taurine derivatives (butyltaurine, for instance) with many possible applications can also be made by the company.

The sodium N-methyltaurine solution contains 34-36% by weight of the sodium salt, together with approximately 1% of free caustic soda. The sodium salt itself behaves as a weak base, and as such, will react with one equivalent of acid.

The bifunctional character of N-methyltaurine which contains both a secondary amine group and a solubilizing sulfonic acid group, makes it of interest to dyestuff and pharmaceutical manufacturers, especially as a stabilizer and solubilizer.

Enamel Resin (602G)

Resistance to soap and good color retention mark new resin for appliance enamels.

A new resin, a vehicle for white baking enamels, is now provided to appliance finish manufacturers by the Plaskon Division of Libbey-Owens-Ford Glass Co., Toledo 6, Ohio. High soap resistance and color retention characterize Plaskon 3101.

Tentative physical constants of Plaskon 3101 are as follows:

Solids content	60 ± 1%
Solvents	Xylol 39.2 Butanol 0.8
Acid No. (solution)	2-6

Plaskon 3381	40
TiO_2—Anatase	100
Xylol	100

Baking Schedule: 20 minutes at 325° F.

Trifluoroacetic Anhydride (602H)

Fluorine chemical promotes esterification of carboxylic acids.

Trifluoroacetic anhydride, powerful esterification agent, is now offered in research quantities by Halogen Chemicals, Inc., 616 King St., Columbia 5, S. C. A pungent, water-

"We've used them for 52 years"

In factories and on farms in many states, V-C Bags are well-known for their ability to stand up under rough, tough treatment—in handling, in shipping and in storage. Since 1898, V-C's better textile bags have been famous for their economy, quality, strength and durability. Multiwall paper bags have now been added to this famous line.

Whether you use multiwall, burlap or cotton shipping bags, you can depend on V-C's bag-making experience to solve your packaging problems with bags engineered to your exact requirements.

Manufactured from top-grade materials, V-C Bags are expertly designed and constructed to provide maximum protection under all conditions. They are available in standard sizes, attractively printed to your specifications.

It will pay you to discuss your bag requirements with a V-C representative. Ask him about V-C's speedy deliveries and expert technical assistance.

white liquid boiling at 40° C., trifluoroacetic anhydride has been found to be especially valuable to promote ester formation between hydroxy compounds and carboxylic acids, both aliphatic and aromatic. The conditions of esterification are relatively mild and the reaction is usually complete within a few minutes.

Acrylic for Extrusion (604A)

New Plexiglas modification is suitable for extrusion molding.

Recent modifications in Plexiglas VM acrylic molding powder have made it as easily handled for extrusion as for injection molding, according to the manufacturer, Rohm & Haas Co.

Physical properties of the powder, a medium heat range material, are unchanged; but the improved formulation makes possible extrusions by standard techniques, with oven drying usually sufficient. High production rates without seed bubbles and "fisheyes" are other advantages claimed on the basis of thorough testing by commercial extruders.

When supplied for extrusion applications, the powder is designated as Plexiglas VM (Extrusion Grade). A technical bulletin on recommended extrusion procedures is available from Rohm & Haas Co., Washington Square, Philadelphia 5, Pa.

Printing Glass Fabrics (604B)

Synthetic rubber latex used in printing paste for glass fabrics.

A recently developed method of screen printing Coronized Fiberglas fabrics has made possible new colorful drapery materials. Called the Hycar-Quilon method, the process is similar in certain respects to water dispersion type resin-pigment systems widely used in printing cottons, rayons, etc. It has proved to be the only process to date which gives excellent wash fastness and resistance to crocking, while still not impairing the wrinkle resistance, drapability, and incombustibility of Coronized glass fabrics.

In the development of the process, Owens-Corning technicians have attempted to simulate standard screen printing procedures so that printers will not encounter difficulties in handling the fabrics.

The Fiberglas drapery fabrics first undergo high-temperature treatment which renders the fibers soft and pliable and also permanently sets the crimp which makes them wrinkle-resistant. A light coating of cationic agent is then applied which acts as a lubricant and protective agent for the bare glass fabric and also prepares the surface for printing.

The Hycar-Quilon printing paste is a liquid dispersion with the consistency of conventional workable pastes to which printers are accustomed. Function of the Hycar ingredient is to serve as a binder for pigments which are subsequently added to the paste. The Hycar latex is brought to proper consistency by the addition of a special thickening agent. After printing, the goods are then cured at 300° F. for approximately ½ minute, then immersed for 15 seconds in a dilute solution of a special after-treatment, and finally dried at 250° F.

The Hycar latex has found wide usage in paper and fabric saturation applications where light stability and freedom from discoloration are important. It contains a special non-discoloring, non-staining antioxidant and a stabilizing agent that improves its mechanical stability and reduces its surface tension to a minimum, thereby improving its penetration.

Amino Acids (604C)

l-Threonine and dl-Allothreonine available in research quantities.

Research quantities of l-Threonine and dl-Allothreonine are now available from the Special Chemicals Division, Winthrop-Stearns, Inc., 1450 Broadway, New York 18.

Introduction of these two essential amino acids brings to twenty-three the total number of varieties offered by the company.

l-Threonine is the naturally occurring isomer and is the form normally required by both mamals and micro-organisms for nutrition and growth. dl-Allothreonine is a stereochemical isomer of threonine.

Polyol (604D)

Polyoxyethylene glucose can substitute for hard-to-get glycerine and other polyols in many uses.

In view of the general polyol shortage, G-2340 (polyoxyethylene glucose) is offered by the Industrial Chemicals Department, Atlas Powder Co., Wilmington 99, Del., as a possible substitute for many uses. Examples: in the leather, fibre, cork composition, gasket and certain paper manufacturing fields.

G-2340 is a water-white, water-soluble liquid, containing about 5% water. It is a polyhydric material, having hygroscopic and humectant properties similar to technical sorbitol, but is less viscous (300 cp. vs. 3,300 cp. for sorbitol; 500 cp. for glycerine).

G-2340 may be diluted with additional water for application as desired. It is compatible with sorbitol solutions, glycerine, propylene glycol and other polyols and might possibly be used as an extender for these materials.

Since G-2340 contains an appreciable amount of reducing sugars, it

Baker's CALCIUM NITRATE

6 Baker Chemicals for the Rubber Industry

- CALCIUM NITRATE
- MAGNESIUM OXIDE
- MAGNESIUM CARBONATE
- LEAD ACETATE
- LEAD PEROXIDE
- CARBON DISULFIDE

The dependable uniformity and high quality of Baker's Calcium Nitrate gives it an ever-widening appeal to the rubber industry.

Especially manufactured for use by latex compounders, Baker's Calcium Nitrate has the exceptionally high purity demanded in a coagulant. It has superior wetting qualities . . . does not harden in the barrels, and remains in workable condition . . . gives more uniform results, with less trouble in process work.

This product is a technical crystal ranging in size from 1½" to smaller sizes. It is a creamy white color. It contains 3 molecules of water of crystallization.

Baker's Calcium Nitrate helps reduce overall production costs—gives you efficient and economical results! Specify it for your processing.

Baker supplies several other chemicals to the rubber industry—chemicals known for their uniformity and dependability. Whatever your needs, your inquiries for samples and prices are invited. Write to J. T. Baker Chemical Co., *Executive Offices:* Phillipsburg, New Jersey.

Methylate with

ANSUL METHYL CHLORIDE

IT'S Easy AND Economical TOO!

ANSUL'S LABORATORY APPARATUS FOR METHYLATION

ADVANTAGES OF CH_3Cl:

1—The rate of methylation is high at moderate (30-60 lb. per sq. in. gage) pressure and temperature. (50-100° C.)
2—More stable than other common methylating agents.
3—Can be conveniently weighed, metered, etc.
4—A low-priced chemical available in cylinders and tank cars.

Recommended for methylation of amines, phenols, alcohols, hydrocarbons and others.

Consult Ansul's research and technical departments on your methylation processes for data of direct benefit to you.

LIQUID Methyl Chloride by ANSUL*

PHYSICAL PROPERTIES

Chemical formula	CH_3Cl
Molecular weight	50.491
Color (gas or liquid)	Colorless
Odor	Ethereal, non-irritating
Melting point	-144°F. (-97.6°C.)
Boiling point	-10.65°F. (-23.7°C.)
Critical Temperature	289.6°F. (143.1°C.)
Critical pressure	969.2 lbs. per sq. in. abs.
Solubility	Methyl chloride in water—3 to 4 volumes methyl chloride vapor in 1 volume of water at ordinary temperatures and atmospheric pressure — methyl chloride in alcohol — readily soluble.
Specific gravity of liquid	.909

*REG. U. S. PAT. OFF.

Send for Bulletin No. C-970, "Methylation with Methyl Chloride," and for "Liquid Methyl Chloride," a treatise on the properties and general handling of Ansul CH_3Cl.

NEW CHEMICAL PRODUCTS——

will have a tendency to tan glues. It is also suggested that its use in foods be avoided because of the lack of feeding studies data.

Pantothenic Assay (606A)

Rapid colorimetric method replaces microbiological assay of vitamin B component.

A rapid colorimetric method for the determination of panthenol and pantothenates has been developed by Hoffmann-La Roche Inc., Nutley, N. J.

The method may be applied for the assay of panthenol and d-calcium pantothenate in pure form as well as in tablets and ampules.

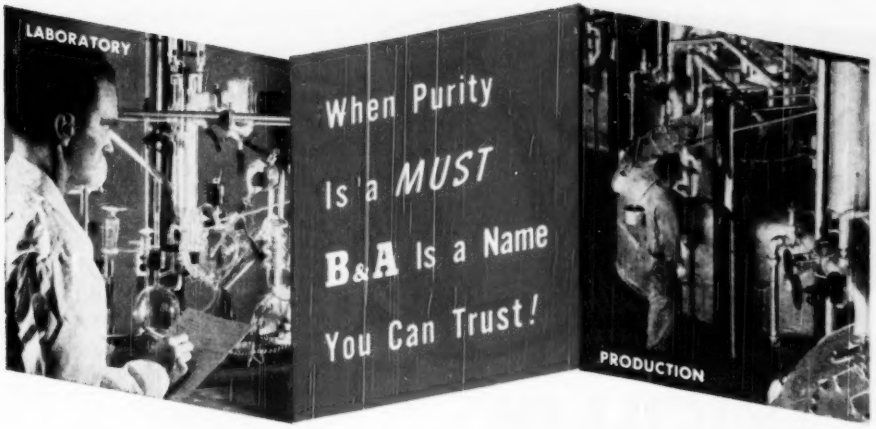
Results can be obtained in shorter time than required by present microbiological procedure, with good agreement between both.

Since panthenol and pantothenates assume considerable importance as members of the vitamin B-complex family, the method should be of great interest to manufacturers of vitamin preparations.

• Production of **Koch acid**, a dye intermediate, has been undertaken by Monsanto Chemical Co. It marks an addition to the company's extensive line of dye intermediate chemicals. Koch acid will be available at competitive prices from the Everett, Mass. plant. (606B)

CHEMICAL SPECIALTIES——

(Continued from page 582)



shipping cases as covered in JAN-P-108. Manufacture of case liners for wooden boxes and water-resistant paper bags, and other flexible wrapping operations are handled by four adhesives meeting requirements of JAN-P-140 specification. Paisley says that the complete line has been tested by approved laboratories and the company certifies that it complies with Government requirements. The JAN specification adhesives are available in one-, five-, and fifty-five-gallon drum packings.

Animal Sterol (606C)

New formulation permits more accurate dispersion in mashes.

Du Pont's Delsterol D-activated animal sterol is now being offered in a new carrier and with a higher vitamin potency that means lower use cost, says the company. The new formulation provides 4000 D units per gram, double the concentration of the familiar 2000-D Delsterol, which is still available.

Refined corn meal is the new carrier used for both 2000-D and 4000-D

ALL BAKER & ADAMSON

"C.P." ACIDS and AMMONIA

EXCEED A. C. S. REQUIREMENTS

Whether for laboratory research or for exacting production use, when your plans call for *highest purity* acids and ammonia—be sure you specify B&A.

Year in, year out Baker & Adamson "C.P." Acids and Ammonia always meet or surpass the strict purity standards set by the chemical profession itself—*through the American Chemical Society*—governing reagents suitable for careful analytical work. Every *ton* —every *pound*—is "quality controlled" at each step on its way to you.

These purity products are packaged in 1 lb. and 5 pint bottles, and in B&A's special 6½ gallon carboy—the completely-covered container with screw-cap closure which is ideally suited for process use.

Production facilities for B&A Reagent Acids and Ammonia are strategically located across the nation; and ready-for-delivery stocks are carried by B&A's huge chain of distributing stations in industrial centers from coast to coast. Any one of the offices listed below will handle your order promptly and efficiently.

PENICILLIN must be potent

Penicillin, one of the miracles of modern medicine, must be delivered to the patient with its effectiveness unimpaired. This great germ-killer is quickly ruined by the soluble elements found in ordinary bottle glass. Until recently, a much more costly glass had to be used for Penicillin containers.

This problem was permanently licked by "Virginia" know-how in developing a successful application of "Virginia" Liquid Sulfur Dioxide (SO_2) in the manufacturing of inexpensive soda-lime glass bottles. The improvement in the quality of these bottles was made possible by the introduction of small quantities of our low-cost SO_2 into the cooling lehr of the glass production line, thus eliminating the undesirable surface alkalis. "Virginia" technicians are thoroughly familiar with this use of SO_2—as they are with its properties as a reducing agent, bleach, antichlor, and pH control—through 29 years' experience with it in over 40 different industries.

This unmatched proficiency in the application of low-cost SO_2 may be of immense value to you if your processes call for a chemical of its varied capacities. It may work wonders with your production costs and the quality of your product. We'd like to cooperate with you in finding out. Send for our free SO_2 booklet. VIRGINIA SMELTING COMPANY, Dept. C1, West Norfolk, Virginia.

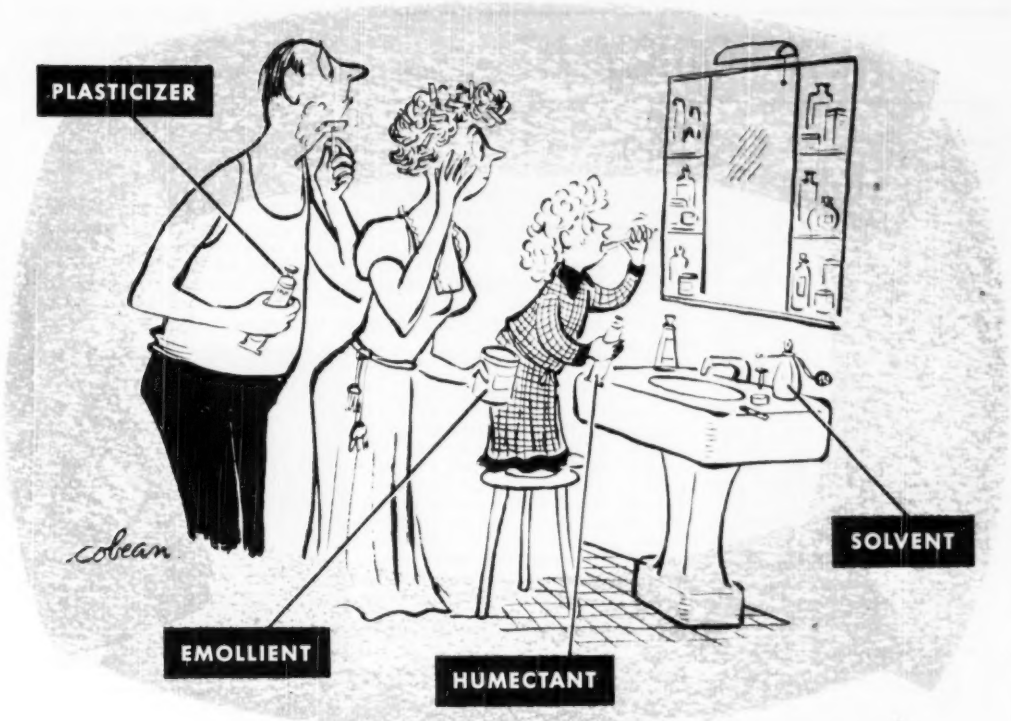
VIRGINIA *Chemicals*

types. The harder granules and more uniform particle size make possible greater precision in accurately dispersing it. This, claims Du Pont, eliminates any tendency of the carrier to cake.

Like 2000-D, the new formulation is used in several ways to fortify mashes. It may be placed directly in the feed mixer with other food elements, or mixed with middlings or other organic feed material before the final mixing. Or it may be made into a D pre-mix with other organic feed ingredients, excluding mineral elements.

Delsterol was developed to provide the specific nutritional element needed to fortify poultry feeds with anti-rachitic factory. It is stable and uniform in Vitamin D potency.



• Acme 2-L-177 and 2-L-178 are the latest additions to the line of **liquid tripoli compositions** made by Hanson-Van Winkle-Munning Co., Matawan, N. J. They are oil-water emulsions, said to combine excellent cutting qualities with unusually high coloring ability for the degree of cut obtained. The former is recommended for maximum cut and the latter for cut-color wherever a general-purpose tripoli would be used. (608A)

• Sharp & Dohme, Inc., Philadelphia 1, Pa., is producing Topaminic, a new **anti-histaminic, analgesic cream** for relief from itching due to dermatitis and other allergic skin disorders.

A soothing, protective preparation, Topaminic suppresses effects of histamine-like substances that may be released in the skin during allergic reaction and arrests the desire to scratch, thus minimizing secondary infections that sometimes occur in irritated skin. With relief of intolerable itching, Sharp & Dohme explain, the physician can better determine the underlying cause and institute specific therapy.

In addition to methapyrilene hydrochloride, a potent antihistamine, the product contains salamine, benzocaine, and hexylated m-cresol in a bland water-washable base. Topaminic comes in 1 oz. tubes. (608B)

• Five important drugs are now available nationally in Ampins, the **automatic injectable ampules** made by Winthrop Stearns, Inc., 1450 Broadway, New York 18. Luminal sodium; procaine penicillin aqueous suspension; procaine penicillin G with aluminum monostearate fortified; salyrgan-theophylline, a mercurial diuretic; and Demerol, 100 mg. 2 cc., an analgesic, are now packaged in the 1 cc. ampules. All types of Ampins come in boxes of five. (608C)

Beauty is a family affair - with Glycerine!

Safeguarding family hygiene and enhancing family beauty are full-time jobs for U.S.P. Glycerine! Everyone from Pop on down depends on toiletries compounded with Glycerine . . . because U.S.P. Glycerine is *physiologically safe*, and because no single substitute can match its unique combination of chemical and physical properties. You'll find it in shaving creams, tooth pastes, liquid deodorants, vanishing creams and liquid face powders—to name just a few. For further information, write for your copy of "*Why Glycerine for Drugs and Cosmetics?*"

U.S.P. Glycerine has become virtually an indispensable ingredient in certain protective creams for industry, and experimentation has already indicated that it is a natural vehicle for new insect-repellent cosmetics. One of its latest applications is described in a patent for a Zirconium-containing deodorant which employs U.S.P. Glycerine in the carrier-base. This cream is said to be capable of absorbing perspiration odors, to be non-acid in chemical reaction and non-irritating to the skin. Details sent on request.

Nothing takes the place of Glycerine

NEW EQUIPMENT

Electronic Flowmeter (610A)

New rotor design eliminates thrust in flowmeter sensing element.

The new electronic flowmeter of Potter Aeronautical Co., 87 Academy St., Newark, N. J., incorporates a sensing rotor which spins freely within a venturi. It comprises a flow-sensing unit having a dynamically balanced rotor and magnet rotating within a non-magnetic housing, and an external pick-up coil con-

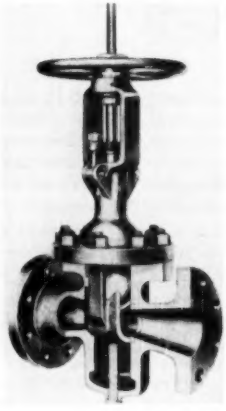
nected to an electronic integrator or totalizer or both.

The housing of the sensing unit is no larger than the line into which it is installed. Three circular spring clips at each end maintain the guide bearings for the rotor shaft in center. Fluid passing through the housing turns the rotor at a speed determined by velocity of the liquid and pitch of the rotor blades. A cylindrical permanent Alnico magnet within the rotor sets up a rotating field which generates AC current in the pickup coil. Frequency is equal to the speed of the rotor when the magnet is two-pole. A four-pole magnet provides twice this frequency. A single, shielded wire conducts the AC current to an electronic unit which either integrates it into DC current for operating a rate-of-flow meter, or it counts and totals the cycles on an electro-mechanical counter of the Veeder-Root type.

Liquid Mixer (610B)

New mixer mixes liquids or liquids and gases without use of a tank.

Developed by The American Well Works, Aurora, Ill., the American Homomix accomplishes instantaneous, violent, uniform blending of a liquid and one or more chemicals or gases with liquid without the use of a mixing tank.



The Homomix is constructed of one or more mixing stages and forms part of the influent piping. Each stage consists of a diffusing impeller rotating in a blending chamber, driven by a continuous shaft direct-connected to the prime mover. Introduction of chemicals to each chamber is made through a tube specially adapted for handling the applied solution. The mixing action is visible through a transparent observation port which may be readily opened for physical examination of the rotating elements. The number of diffusing stages can be selected to comply with the number of chemicals requiring mixing in a particular process.

The chemical solution enters at the eye of the impeller from where it is carried by the vanes and accelerated to a high-velocity and thrown out by centrifugal force into the annular channel, or diffusion casing. The simultaneous circulation of a small portion of the raw liquid with the injected chemical solution provides the volumes necessary to obtain optimum dispersion. The diffusing action of the impeller will effectively disperse gases such as carbon dioxide in the form of minute bubbles instantly and completely throughout the liquid passing through the unit.

Ball Valve (610C)

New valve features straight-line discharge characteristics.

W-K-M Co., Houston, Texas, has developed a new valve for general duty, the W-K-M venturi-ball valve.

It is designed for throttling applications in high pressure, corrosive or erosive applications and features straight line discharge characteristics. Non-turbulent flow is possible over a wide range without destructive erosion or wire drawing.

Wide open flow is unobstructed, non-turbulent with negligible pressure drop. When tightly closed the ball seats tightly regardless of pressure and flow conditions. Line contact between ball and seat assures tight, absolute shutoff. It is self-cleaning and purging due to the venturi design. The ball seats in a different position each time, distributing wear over its entire surface. There are two seats and the valve may be reversed in the line to double its useful life. The valve is available in different materials.

Transfer Pump (610D)

New pump with air line pressure offers a safer way to remove corrosive liquids from stainless steel containers.

Safe and convenient transfer of acids and other liquids from stainless steel containers is now possible with

the GS No. 17 pump of General Scientific Equipment Co., 2700 W. Huntingdon St., Phila. 4, Pa. Liquids come in contact only with the corrosion-resistant tube.

The pump is fitted with a safety valve for air line pressure and a hold down clamp to secure the pump into the container, together with 25 feet ⅜" air hose with male or female coupling and chuck attached. Both lead and Saran plastic tubes are supplied.

Air Cleaner (610E)

New electronic air cleaner utilizes upward or downward flow.

A new Precipitron electronic air cleaner, constructed for upward or downward air flow, is now available from Westinghouse Electric Corp., 200 Readville St., Hyde Park, Boston 36, Mass.

Designed to remove air-borne solids from normal air, the new Precipitron charges the solid particles positively, then passes the air through a set of alternately charged collector plates where the solids are removed by electrostatic attraction.

The new Precipitron is available in capacities of 1200 cfm and up and will remove 90% of all air-borne particles traveling at 333 fpm, and 85% of those traveling at 400 fpm.

The new Precipitron features vertical air flow which permits mounting the unit in a vertical duct to save floor space. The unit frame, with a projected floor area of approximately four square feet for the smallest unit to 16 square feet for the largest unit, serves as a support for air

Beckman pioneers another instrumentation advancement . . .

SINGLE BEAM *direct* Transmittancy *recording* *with* BECKMAN *infrared spectrophotometers*

NEW SINGLE BEAM SYSTEM IS SIMPLE, ACCURATE, RELIABLE

The Beckman Single Beam Direct Transmittancy Recorder employs the memory standardization principle, using reliable electronic circuits instead of complicated mechanical-optical arrangements. It successfully combines the highest accuracy with the utmost in reliability and convenience. A standardizing run is made on the empty or solvent-filled absorption cell. During this run the signal from the photoreceiver is automatically maintained constant, and the resulting slit width vs. wavelength function is "memorized" on a wire recorder. The sample is then placed in the same cell, and information played back from the wire recorder automatically controls the wavelength and slit drive motors to reproduce precisely the conditions which produced the constant 100% reference level. Any absorption resulting from the sample is accurately and automatically recorded directly in transmittancy. On repeat runs, the same reference wire is used, eliminating repetition of standardizing measurements.

Single beam transmittancy recording retains the excellent resolution, low stray light, high stability and drift freedom, and the wavelength accuracy of the well-known Beckman Spectrophotometers. Other advantages are summarized at the right.

THREE UNEXCELLED INSTRUMENTS FOR ANY REQUIREMENT

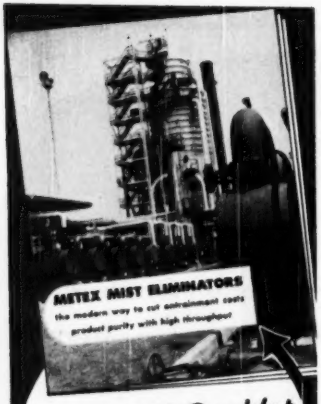
Beckman Single Beam Direct Transmittancy Recording is available either (1) as an accessory unit for direct installation on any Beckman IR-2 Spectrophotometer, or (2) with the IR-2 as a complete instrument, or (3) in the new unsurpassed Beckman IR-3 Spectrophotometer – the most versatile, most accurate, most complete – and by all standards, the *finest* spectrophotometer money can buy.* For further information on these instruments write . . .

BECKMAN INSTRUMENTS control modern industries

Beckman Instruments, Inc., South Pasadena 17, California

Factory Service Branches: NEW YORK · CHICAGO · LOS ANGELES

**As in all Beckman instruments, your money buys more value than in any similar product.*



IMPORTANT ADVANTAGES of the Beckman Transmittancy Recorder

- **GREATER CONVENIENCE:** The single-beam principle eliminates troublesome, time-wasting cell- and beam-matching problems.
- **GREATER VERSATILITY:** Greater versatility and simplicity and lower costs are assured, since special cells and attachments need not be duplicated for use in a reference beam.
- **GREATER ACCURACY:** The single-beam principle eliminates problems of making a beam attenuator achromatic, linear and free of vignetting effects.
- **MINIMUM STRAY LIGHT:** Only these single beam instruments use a filter-type beam chopper, reducing stray light effects to a minimum (less than 2% at 15 microns with the IR-2).
- **MINIMUM SCANNING TIME:** Optimum recording efficiency is achieved because each spectral slit width is traversed in a time proportional to the response period of the recording system. Any other scanning rate loses either resolution, time or accuracy.
- **MAXIMUM RESOLUTION:** Slit width control has the advantage that the instrument is always working at maximum resolution for the chosen amplification and scanning speed.
- **FLEXIBILITY OF CONTROL:** Operating speed, resolution and chart scales can be easily varied over wide ranges. A single control adjusts scanning time per spectral slit width from 1 second to 128 seconds by factors of 2. The wavelength motor speed is electronically controlled with no gear shifting needed to change scanning speed.

In addition to recording linearly in wavelength, a unique electronic system enables recordings to be made linearly in other functions such as frequency or log wavelength.

Beckman Instruments include: pH Meters and Electrodes — Spectrophotometers — Radioactivity Meters — Special Instruments

This NEW Booklet can help you cut entrainment costs

Condensed information on the function and applications of Metex Mist Eliminators and economies effected through this modern development in Entrainment Separation.

The effectiveness of Metex Mist Eliminators for liquid-gas separation has been demonstrated by installations of several years standing in many different types of processing equipment. Equally adapted to installations in new or existing equipment—vacuum pipe stills, scrubbing towers, knock-out drums, evaporators and the like—their use has resulted in such marked economies as:

1. 95% or better entrainment removal
2. High end-product quality even with lower-cost raw materials
3. Operation at full capacity without contamination
4. Practical elimination of reruns

Write today for your free copy. The coupon below is for your convenience. No obligation of course.

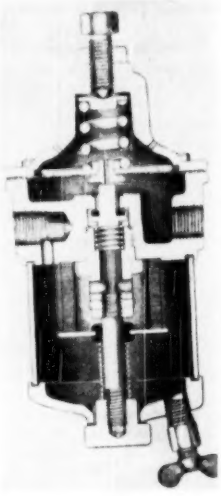
cleaning components as well as a structural casing. With a frame height of only 34½", unused space above and below the unit is used for inspection and servicing access.

• A hydraulically powered **oscillating feeder** has been developed by Proctor & Schwartz, Inc., 7th St. and Tabor Rd., Philadelphia 20, Pa. The purpose of the feed is to distribute evenly and uniformly upon a wide conveyor any loose, flaky or granular material. The hydraulic power gives simple and accurate control of the speed and travel of oscillation. It further permits a smooth reversal at controlled rates.



A hopper receives material from the feed chute and deposits it on the oscillating feeding conveyor. The speed of the feed conveyor can be adjusted to change the loading characteristics. The length of the feed conveyor can be supplied to proper feeding. The feed conveyor is mounted on the top of a column, providing it with a fulcrum point and a mount for the oscillating controls quickly adjustable so as to limit the travel to obtain the desired path over the main conveyor. (612A)

• A new 2" **meter** for industrial liquids has been added to the line of Xacto meters of Bowser, Inc., Fort Wayne, Ind. This positive displacement meter has five vertical pistons and gives highly accurate measurement in the 110 gpm range. All interior parts are constructed of either special hard carbon or stainless steel to eliminate metal-to-metal contacts at friction points. The cylinder block and bowl is available in cast iron or bronze. Straight reading, predetermined quantity or ticket printing dials can be supplied. (612B)

• Penn Industrial Instrument Corp., 3116 N. 17th St., Phila. 32, Pa., has introduced a new automatic **flow controller** which provides low maintenance with high accuracy and fast response. Flow rate is measured by the Penn Magna Clutch flow meter which utilizes a frictionless magnetic coupling between the float on one hand and the pen and control mechanism on the other. High accuracy is achieved by the large float and long float travel combined with true frictionless design. To this is added the sensitive pneumatic controller with fully adjustable automatic reset and proportional band adjustable from 0-175%. Low maintenance is achieved by eliminating the stuffing box or pressure tight bearing and by use of "O" ring manometer seals moving part, the float, which can be removed. (612C)

• The Cleveland Vibrator Co., 2864 Clinton Ave., Cleveland, O., has simplified the design of its type "F" air-powered **bin vibrator**. The number of major parts has been reduced to five components, mounting base plate, housing, spring, piston, and head—are shown in a sequence with four longitudinal body bolts and special stop lock nuts. (612D)

• The new airpak of the Conoflow Corp., 2100 Arch St., Philadelphia 3, Pa., is a combination of regulator, **filter**, and dripwell. Constructed entirely of brass and stainless steel,

the new unit provides maximum resistance to corrosive atmospheres. Its capacity averages approximately 25 cfm. A side mounted drain cock permits horizontal as well as vertical mounting without sacrifice of filter area or dripwell volume.

The filter medium is phenolic resin-impregnated cellulose capable of removing oil and water and particles down to 40 microns. Airpak is available in reduced pressure ranges of 0-25, 0-50, 0-125 usig. (612E)

• "Cold rubber" is being used in some of the **conveyor and elevator belts** manufactured by The B. F. Goodrich Co., Akron, O. When properly compounded "cold rubber" should add from 10 to 25% more wear in certain service. (612F)

• The new **electric scale control** of Aqua Electric Scale Control, Inc., 2028 E. 22nd St., Cleveland 15, O., will reduce or prevent hard scale formation in water cooled equipment. Water is passed through an electric field of the proper intensity and the colloidal particles pick up an electrical charge which is adjusted to the electrical conductivity of the water itself. Thus, the particles are no longer attracted to, and do not build up on the metal surfaces which they contact. (612G)

Leading shippers of chemicals everywhere rely with confidence on our modern single and multiple compartment tank cars. That's because they are especially constructed to meet the particular needs of the chemical industry—engineered specifically for hauling chemicals to market safely and economically.

Our 42 years' experience in specialized transportation service, and in solving all types of shipper problems, is yours when you ship via North American. Our friendly experts will welcome you at any of the offices listed below.

THE H.K. FERGUSON COMPANY
INDUSTRIAL ENGINEERS & BUILDERS

Executive Offices: Ferguson Building, Cleveland; New York Office: 19 Rector Street; Houston Office: M & M Bldg.; Chicago Office: 120 S. LaSalle St.; Los Angeles Office: 2975 San Fernando Rd.; Cincinnati Office: 21 E. 12th St.

• Utilizing the strength, lightness and dependability of modern stainless steel, American-LaFrance-Foamite Corp., Elmira, N. Y., has produced a new line of 2½ gal. **fire extinguishers.**

The manufacturers claim the new extinguishers are twice as strong as the old style fabricated copper units and about 50% lighter in weight without the charge. (614A)

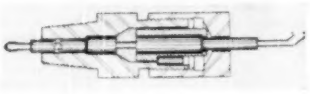
• A method of flame spraying **polyethylene coatings** on steel surfaces has been perfected by Houghton Laboratories, Olean, N.Y. The Houghton process uses no solvents and applies coatings in thicknesses from 1/32″ to 1/4″ to greatly improve corrosion resistance. (614B)

• Positive (flow) regulation of processing tanks' contents from a single point of control is provided by the **3-way-valve,** the only 3-Way-Valve with a 2 part plug type key. It is produced by F. H. Langsenkamp Co., 227-235 E. South St., Indianapolis, Ind.

Action starts with movement of control to desired position indicated on valve control quadrant. Handles are then locked in place, effecting complete and positive seal up to 60 psi.

Usually fabricated in pure nickel, nickel alloy or stainless steel, valves can be obtained in any desired metal. Available in 2½″, 3″ and 4″ IPS sizes or sanitary threads. (614C)

• Metalsmiths, Div. of Orange Roller Bearing Co., Inc., 560 White St., Orange, N.J., is fabricating **stainless steel endless belts** for conveyors.



Features offered are any desired width in one piece; invisible welded endless construction; controlled width and camber; surfaces polished to suit needs; doctor blades at head pulley can be used to keep belt clean. (614D)

• Babcock & Wilcox Tube Co., Beaver Falls, Pa., has increased the size range of its **seamless steel tubing.** B&W now can produce seamless hot finished tubing in outside diameters up to 9⅝″ and seamless cold drawn tubing in outside diameters up to 8⅞″. The former maximum OD was 8⅝″. (614E)

• The Cowles Co., Inc., Cayuga N. Y., is producing a new **dissolver,** Model 7VT, which works batches of 5 to 100 gals. ranging in viscosity from 1 to 30,000 centipoises. The entire motor, bridge, and dissolver unit may be adjusted in height through a range of 11″ by an elevating screw, which makes the unit adaptable to containers of varying depth. The bridge support can be tilted through an angle of 60° for quick removal of the impeller from tanks. A five HP, explosion-proof motor is on the bridge. Various types of stainless steel impellers are available.

• Pressure band **pipe couplings,** made by Morris Coupling and Clamp Co., 1233 Beaver Ave., Ellwood City, Pa., are now available for pipe sizes up to 8″ according to an announcement. In addition to the standard zinc coated steel line, all aluminum couplings also are available. (614F)

• A new bare wire **thermocouple gland** is available from the Conax Sales Co., Inc., Kenmore 17, N. Y. It is designed to provide the greater accuracy and quicker response of bare wire thermocouples without the

leakage and expense usually associated with this method of temperature measurement. Sealing the wires by compressing dry powdered talc between two ceramic insulators provides an electric insulation which is virtually unaffected by either temperature or chemical reaction.

The new gland may be used with temperatures from —100° F. to +1600° F. and will withstand pressures up to 4000 psi. It is available in models for standard 20 gage thermocouple wires, 14 gage thermocouple wires and for use with terminal block or conduit. (614G)

• Cohrlastic 3500 **silicone rubber-coated Orlon** is fabricated by The Connecticut Hard Rubber Co., New Haven, Conn. It is impermeable, heat and cold resistant, has good dielectric and high tensile strength, and it is outstanding as a diaphragm material.

Such diaphragms may be flat or convoluted. They are light and strong and operate from —75° F. to 300° F. They are extremely flexible and have a long flex life and are particularly useful where pressure differentials are low and quick response to a slight change is desired. Cohrlastic 3500 can be supplied as a fabric .010″ thick, .017″ thick, or in the form of finished diaphragms. (614H)

• The Cowles Co., Inc., Cayuga, N. Y., has introduced two new hydraulic lift **dissolvers.** Both models are standard dissolvers intended for plant operations where it is faster and more convenient to process materials in tanks brought to the machines. The impeller raises and lowers hydraulically by water pressure so that it clears the top of containers and can be positioned correctly for the maximum effect. (614I)

Sulfides To Your Schedule...

One of the important reasons for the popularity of Hooker as a basic source for Sulfides lies in the Hooker scheduling and delivery policy.

Much time and thought has been given to shipping, and this planning combined with Hooker's location at one of the important rail centers of the nation, enables Hooker to deliver—on schedule—as promised. This permits you to keep your inventory investment to the minimum while at the same time our ample stocks enable you to meet additional requirements without any difficulty.

All Hooker products are noted for their purity and Sulfides are no exception. Sodium Sulfide (Fe 8 ppm Max.), and Sodium Sulfhydrate (Fe 5 ppm Max.) are of uniform quality that eliminates costly variations in quality of the finished product. There are also added savings due to the rapid and complete solubility of these high purity Sulfides. The clean solution can be used without settling or decanting—a worthwhile time saver.

A request on your company letter head will bring samples and Technical Data Sheets.

SODIUM SULFIDE—Na_2S

Mol. Wt. 78.1
M.P. ..... 100°C

Light buff colored solid in flake form. Rapidly soluble in water; slightly soluble in alcohol; insoluble in ether. Also available in solid form.

Analysis

Na_2S	60 to 62%
NaCl	1.5% Max.
Other Na Salts	2.0% Max.
Fe	8 ppm Max.
Cu, Ni, Cr, Mn, Pb	1 ppm Max.
Water of crystallization	35% Min.

Uses

In manufacture of dyestuffs, chemical intermediates, paper pulp, soap and rubber, as an ingredient of dye liquor for textile dyeing; boiling out linen; ore flotation and metal refining; in unhairing hides and wool pulling; desulfurizing viscose rayon.

SHIPPING CONTAINERS

Flake: Steel drums ..... 90 & 350 lbs. net
Solid: Steel drums ..... 625 lbs. net

SODIUM SULFHYDRATE—NaSH

(sodium hydrosulfide)

Mol. Wt. 56.1
M.P. ..... 55°C

Light lemon colored solid in flake form. Completely and rapidly soluble in water, alcohol and ether.

Analysis

NaSH	70 to 72%
Na_2S	2.5% Max.
NaCl	0.8% Max.
Na_2SO_3 and $NaHCO_3$	0.4% Max.
Fe	5 ppm Max.
Cu, Ni, Cr, Mn, Pb	1 ppm Max.
Water of crystallization	28 to 26%

Uses

In preparation of dyestuffs and other organic chemicals such as thioamides, thiourea, thioglycolic acid, thio- and dithio-benzoic acids, sodium thiosulfate; in unhairing hides, in desulfurizing viscose rayon.

SHIPPING CONTAINERS

Lacquer-lined steel drums .. 90, 350 lbs. net

PACKAGING & SHIPPING

by T. PAT CALLAHAN

Unexplored Potential in Air Freight

A recent article in the U. S. Department of Commerce publication, *Containers and Packaging Industry Report*, outlines the possibilities of air freight and the packaging problems it entails. Although some of the more hazardous chemicals are presently restricted from air transportation or allowed only to a limited degree, it seems probable that air transportation will play a greater role in shipping chemicals.

In the article entitled "Air Freight —A Packaging Challenge", the term "air freight" applies to cargo that is neither air express nor air parcel post. It is a new basic method of shipping designed to move merchandise at air speed in a regular flow on a volume basis. Merchandise moves on an airport-to-airport basis. Air freight industry is still too new for all of its potentialities to have been explored, but additional uses and advantages are turning up from day to day. It has two distinguishing features for the shipper: speed and specialized service.

Although interest among the container manufacturers is increasing, research in this field by progressive container producers has hardly begun, principally because air transportation has not yet represented a sufficient volume to justify extensive expenditures for research and development. Therefore, it remains for the airlines themselves to take the lead in working with the shippers and the container manufacturers in developing suitable packaging.

A wide variety of cargo can be shipped by air. Some commodities, however, will not be accepted for carriage by air while others are prohibited, due to the nature of the product itself, unless special packaging is provided and clearance for air shipment is obtained. In these categories are such items as explosives, inflammables, acids, radium, radioactive or magnetic materials, small-arms and ammunition, and other items which are considered hazardous.

According to recommendations of the working group on Civil Transport Aircraft Prototype, Civil Transport Aircraft Evaluation and Development Board, the type of aircraft most needed to develop air cargo is a long-haul air freighter capable of carrying a minimum of 15 tons of payload for a nonstop flight of 2,000 miles at an average speed from start to stop of 300 miles an hour. This plane should be able to operate from a 4,000 foot airfield to permit using relatively small airports. It should also have a cargo floor at truck bed height to expedite loading and unloading. The estimated direct operating cost of this freighter is 3.75 cents per ton mile. New planes, specifically designed to haul commercial cargo, will aid in the achievement of superior performance at lower operating cost.

Bibliography Published On Container Coatings

A new bibliography on container coatings has been published by the Office of Technical Services of the U. S. Department of Commerce. This bibliography, prepared by the Army Quartermaster Technical Library in Philadelphia, provides abstracts of some 150 patents and research papers on food and other types of container coatings, published since 1941. Author, inventor and patent indexes are included. This bibliography may be ordered from OTS, Washington 25, D. C., and is Order PB 100 864, price $1.25.

Conveyor Designed for Valve Bag Packer

(616A)

A new motor driven conveyor especially designed to operate in connection with valve bag packers has been developed by the Flexoveyor Manufacturing Co., 1220 S. Acoma St., Denver, Colo. A series of endless spring belts running over

grooved rolls forms the conveying element which is reversible. Any loose material collecting on the outside of the bag or around the packer drops through the springs and onto the floor where it can be cleaned out at regular intervals.

It avoids the difficulty of material building up on belts and bags stalling. The fluttering action of the springs make them self cleaning. Only 7" of headroom is required making it possible to install the unit close to the floor or leave sufficient room to telescope a carloading conveyor underneath. It can be designed for special conditions.

Packaging Group to Study Parenteral Closures

A new committee has been formed in the Materials Division of the Packaging Institute to study problems of parenteral closures. It plans to hold meetings of interested users with the institute alone, and later on with stopper manufacturers, to try to solve mutual problems by joint effort and cooperation with suppliers.

Chairman of the Parenteral Closure Committee is J. A. Elder, Merck and Co. Other members are C. B. Burnside, Eli Lilly & Co.; P. Van Gieson, Lederle Laboratories, and D. Seif, E. R. Squibb & Sons.

Information Service on Packaging Machinery

A Packaging Machinery Information Service has been established by the Packaging Machinery Manufacturers Institute, at its new office headquarters at 342 Madison Ave., New York.

A clearing house of information on all types of packaging machinery has been maintained by the institute for a number of years for the use of its members and for the general public, both domestic and foreign. The new office will permit its expanding this reference service and provide filing space for a large supply of literature on packaging machinery and related subjects.

A semi-monthly bulletin service on packaging machinery requirements, is a feature of the institute's service to members.

Standards Developed for Industrial Trucks

Users of industrial power trucks can now benefit from the safe practices in design and use of such equipment that have been established by a nationwide agreement among users, safety engineers, and manufacturers. The recommendations, representing a consensus of all who are substantially concerned, have been published as a Safety Code for Industrial Power Trucks and approved by the American Standards Association as American Standard (B56.1—1950). This 32-page bulletin is available at 85 cents either from the ASA, 70 E. 45th St., New York 17, N. Y., or the American Society of Mechanical Engineers, 29 W. 39th St., New York, N. Y.

Of particular interest to users are the sections outlining general safety

Announcing:

PITTSBURGH PX PLASTICIZERS

a new wide range line

from a single producer

Pittsburgh Coke & Chemical Company is now producing ten quality-controlled Pittsburgh PX Plasticizers—providing the plastics, rubber, and protective coatings industries with a new, reliable source of supply.

The objective of the Plasticizer Division is to make available from one integrated source of supply a line of highest quality plasticizers in sufficient variation of type to fill virtually every need. Pittsburgh Coke & Chemical Company's integrated operations, from the mining of coal to the purification of the finished plasticizer, permit quality control of all manufacturing steps. The Company's position as a raw material producer gives maximum assurance of continuity of supply.

Established evaluation facilities provide our customers with excellent technical service, while continuing research will provide new and improved products for the future.

Descriptive literature on Pittsburgh PX Plasticizers is available upon request. Please address your inquiries to:

Pittsburgh PX Plasticizers

- PX-104 DiButyl Phthalate
- PX-108 DiIsoOctyl Phthalate
- PX-138 DiOctyl Phthalate
- PX-238 DiIsoOctyl Adipate
- PX-239 DiHexyl Adipate
- PX-404 DiButyl Sebacate
- PX-408 DiIsoOctyl Sebacate
- PX-650 TetraHydroFurfuryl Oleate
- PX-816 TriPhenyl Phosphate
- PX-917 TriCresyl Phosphate

Check the above list for your needs—then write today for individual bulletins which give full commercial and technical information about each of the Pittsburgh PX Plasticizers.

regulations, such as qualification and training of operators, battery charging and changing facilities, marking of aisles, lighting of operating areas, as well as specific safety rules and regulations that have been adopted in part or in full in many industrial plants and warehouses.

Portable Nailer (618A)

A new foot-operated automatically fed portable nailer has been developed by the Heller Co., 2153 Superior Ave., Cleveland 14, O. Said to be five times faster than ordinary nailing, the new machine drives through light metal, prestwood, into hard or soft wood. The feeding chamber

holds over a hundred Lock nails that come adhered together in one long strip for fast loading. No skill or experience is needed to operate the nailer, and the worker easily develops speed and accuracy.

The longest Heller Lock nail (they range in size from 3/8" to 13/16" long, are spear-pointed) is driven and countersunk with one touch of the pedal. The nailer has a two-way adjustable table to handle a large variety of work.

H_2SO_4, Poisons Covered in ICC Regulations Changes

Fundamental changes in the section on sulfuric acid and a clarification of the definition of Class B Poisons are the most significant amendments to the Interstate Commerce Commission Regulations that went into effect August 29, 1950. The following amendments cover these and other changes of interest to the chemical industry contained in this latest revision:

Section 72.5 List of Explosives and Other Dangerous Articles, was amended as is shown in the following table:

Article	Classed as	Exemptions and packing (Section references to Part 73 (formerly Part 3))	Label required if not exempt	Maximum quantity in one outside container by rail express
(Add) Dichlorodifluoromethane and difluoroethane mixture (*constant boiling mixture*)	Noninf. G.	302, 303	Green	300 pounds
Flame retardant compound, liquid	Cor. L.	244, 280	White	10 gallons
Sodium chlorite solution (not exceeding 40% sodium chlorite)	Cor. L.	244, 263	White	4 gallons
Sodium, metallic, dispersion in organic solvent	Inf. S.	No exemption 217	Yellow	10 pounds

This amendment provides for shipment of new products.

Section 73.154 has been amended by addition of the following:

(zz) Sodium, metallic, dispersion in organic solvent.

Here too, this addition covers a new material.

Section 73.158(b) has been amended as follows:

(b) Spec. 15A or 15B.—Wooden boxes, with inside fiber containers securely closed by taping or gluing, not over 1 pound capacity each. Each inside container surrounded by asbestos or fire-resistant cushioning material which will protect contents with equal efficiency; net weight in outside container must not exceed 50 pounds.

This amendment provides for use of cushioning materials other than asbestos which tests have shown are satisfactory.

Section 73.190(b)(7) has been amended as follows:

(b)(7) Spec. 103 or 103W.—Tank cars, without bottom discharge oulet and with approved dome fittings, external heater systems, and with insulation at least 4 inches in thickness, except that thickness of insulation may be reduced to 2 inches over external heater coils. The material must be immersed in water and must be loaded at a temperature not exceeding 140° F. and then cooled until the water has a temperature not exceeding 105° F. before car is offered to carrier. The water must be loaded in the dome to not more than 50 per cent of the capacity of the dome.

This amendment clarifies the previous regulation and permits thickness of insulation of 2" over external heater coils. This refers to the shipment of phosphorus, white or yellow in specification 103 or 103W tank cars.

Section 73.207(e) has been amended to read as follows:

(e) Sodium sulfide containing 35 per cent or more combined water by weight, fused or concentrated but not ground (may be chipped, flaked, or broken), is exempt from specification packaging and labeling requirements, when packed in steel barrels or drums that are equipped with moisture-tight closure.

Here again, the amendment clarifies the original section, which read: With closures treated to prevent the entrance of moisture in quantities sufficient to create a hazardous condition in transportation.

Section 73.217 has been added as follows:

73.217 Sodium, metallic, dispersion in organic solvent.

(a) Sodium, metallic, dispersion in organic solvent must be packed in specification containers as follows:

(1) Spec. 15A.—Wooden boxes with inside containers which must be metal cans not exceeding one quart capacity, and each such can must be packed in another metal can and cushioned on all sides with at least one inch of soda ash. Both the inner and outer metal can shall be equipped with an airtight closing device secured by positive means (not friction). Gross weight of completed package must not exceed 100 pounds.

This new section provides for shipment of this new material.

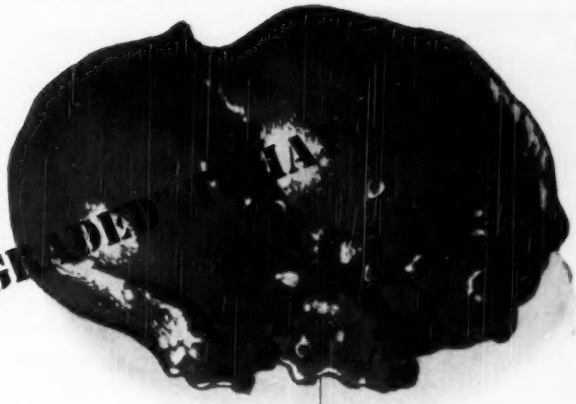
Section 73.263 has been amended as follows:

73.263 Hydrochloric (muriatic) acid, hydrochloric acid mixtures, and sodium chlorite solution. (a)(1) Hydrochloric (muriatic) acid, hydrochloric acid mixtures, and sodium chlorite solution not exceeding 40 per cent sodium chlorite must be packed in specification containers as follows:

This amendment provides for the shipment of sodium chlorite solution not exceeding 40 per cent sodium chlorite, which had not heretofore been covered by the regulations.

Section 73.263(a)(10) has been amended as follows:

(a)(10) Spec. MC310.—Tank motor vehicles, lined with rubber or equally acid-resistant material of equivalent strength and durability.



This amendment permits use of materials other than rubber for the shipment of hydrochloric acid, hydrochloric acid mixtures, and sodium chlorite solutions not exceeding 40 per cent sodium chlorite.

Section 73.272 has been amended as follows:

73.272 Sulfuric acid. (a) Sulfuric acid (oleum, oil of vitriol, etc.) must be packed in specification containers as follows:

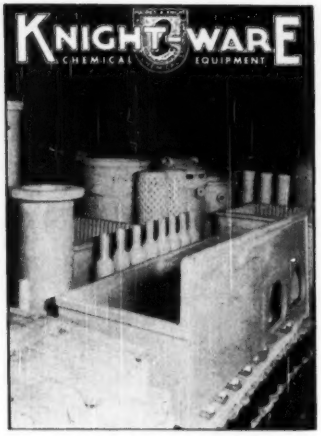
(b) Sulfuric acid solutions of not over 25 per cent concentrations, in inside containers of not more than 8 ounces capacity each, resistant to the lading, packed in strong outside containers and cushioned with absorbent material in sufficient quantity to completely absorb liquid contents in event of breakage, are exempt from specification packaging, marking and labeling

THE CASE OF THE "DEGRADED" TOMATO

. . and how Fine Chemicals now keep them in "Extra Fancy" shape

Often a small investment in Mallinckrodt Fine Chemicals can substantially increase product quality and profit. For instance: to merit "Extra Fancy" grade and prices, canned tomatoes must be *firm*. But tomatoes red-ripe when picked soon "degrade" when processed due to the softening action brought about by their natural enzymes and by heating.

Canners learned they could prevent the profit-stealing effects of enzyme action and heating by adding a trace of calcium salt . . . but they needed Calcium Chloride pure enough for food use. Mallinckrodt research developed the product—refined to remove harmful impurities such as arsenic and lead. Today the canners produce a greater proportion of premium quality grades at only a nominal increase in cost.



Mallinckrodt Research has helped scores of other progressive industries increase quality and profits by developing new applications or entirely new products. Mallinckrodt's fine chemical experience may prove to be valuable to you, too. It pays to find out.

FINE CHEMICALS Mallinckrodt SINCE 1867

Section of kiln before firing

CORROSION PROOF
in any form

Knight-Ware, a quality ceramic, is corrosion-proof throughout its entire body and can be made in almost any design at relatively low cost. For example: Among the pieces shown in the kiln (above) are ducking rolls for carrying strip steel in and out of acid baths, tanks and filters for handling drugs and fine chemicals, and an unusually large one-piece laboratory sink.

Besides special designs, Knight-Ware is also made in a wide selection of standard types, such as:

Suction Filters
Drain Lines
Fume Ducts
Tower Packings
Plug Cocks

Tanks	Jars
Kettles	Towers
Sumps	Sinks

When writing for information on Knight-Ware, please mention type of equipment needed and service conditions involved.

MAURICE A. KNIGHT
210 Kelly Ave., Akron 9, O.
Acid and Alkali-proof Chemical Equipment

requirements for transportation by rail freight, rail express or highway. When for transportation by carrier by water they are exempt from specification packaging and labeling requirements and marking, other than name of contents.

(c) For sulfuric acid of any conc.:

(1) Spec. 15A, 15B, 15C, 16A, or 19A.—Wooden boxes with glass or earthenware inside containers, not over one gallon capacity each, except that such containers up to three gallons capacity may be used when only one such container is packed in each outside wooden box.

(2) Spec. 31.—Jugs in tubs.

(3) Spec. 11A or 11B.—Wooden barrels or kegs with glass or earthenware inside containers not over 2 gallons capacity each.

(4) Spec. 1X.—Boxed carboys of 5 to 6 gallons capacity; single-trip for export only. For shipment via common carrier by water to non-contiguous territories or possessions of the United States and foreign countries; shipments from inland points in the United States which are consigned to such destinations are authorized to be transported to ship side by rail freight in carload lots only and by motor vehicle in truckloads lots only.

(d) For sulfuric acid of concentrations not less than 100 per cent and not more than 115 per cent (approximate):

(1) Spec. 5C.—Metal barrels or drums of Type 304, 316, or 347 stainless steel or other types of stainless steel of equivalent corrosion resistance and physical properties.

(e) For sulfuric acid of concentrations not to exceed 100.5 per cent:

(1) Spec. 1A or 1C.—Carboys in boxes or kegs.

(2) Spec. 1D.—Boxed glass carboys of not over 6.5 gallons nominal capacity.

(f) For sulfuric acid of concentrations not to exceed 93.2 per cent (approximately 1.835 specific gravity) (66° Baume):

(1) Spec. 5H.—Metal barrels or drums.

(g) For sulfuric acid of concentrations 77.5 per cent (approximately 1.7019 specific gravity (59.8 Baume) or greater concentrations with or without an inhibitor, provided such acid has a corrosive effect on steel measured at 100° F. no greater than 66° Baume commercial sulfuric acid:

(1) Spec. 5A.—Metal barrels or drums.

(2) Spec. 17F.—Metal barrels or drums (single trip only). Drums equipped with vented closures of an experimental type approved by the Bureau of Explosives are also authorized for export shipments.

(h) For sulfuric acid of concentrations 65.25 per cent (approximately 1.559 specific gravity) (52° Baume) or greater concentrations, provided the corrosive effect on steel measured at 100° F. is not greater than that of 52° Baume commercial sulfuric acid:

(1) Spec. 60—Portable tank.

(2) Spec. MC 310.—Tank motor vehicle.

(3) Spec. 103A or 103A-W.—Tank cars.

(i) For sulfuric acid of concentrations not to exceed 51 per cent (approximately 1.408 specific gravity) (42° Baume):

(1) Spec. 5D.—Rubber-lined metal drums.

(2) Spec. 60.—Portable tanks (rubber-lined).

(3) Spec. MC 310.—Tank motor vehicles (rubber-lined).

(4) Spec. 103B or 103B-W.—Tank cars.

(j) Gaskets must be in a plastic condition when applied to carboys in boxes, barrels or kegs containing water-white sulfuric acid (electrolyte grade) of concentrations 77.5 per cent (approximately 1.7019 specific gravity) (59.8° Baume).

(k) Soft rubber gaskets are authorized on carboys in boxes, barrels or kegs containing sulfuric acid of not over 51 per cent concentrations (approximately 1.408 specific gravity) (42° Baume).

(l) Because of the present emergency and until further order of the Commission, sulfuric acid may be offered in transportation by carriers by water in conformity with Regulations for Explosives or Other Dangerous Articles on Board Vessels, Sec. 146.23-10, issued by the Commandant of the Coast Guard.

This amendment clarifies existing specifications for packing of sulfuric acid. It also adds (d)(1) for sulfuric acid of concentrations not less than 100 per cent and not more than 115 per cent (approximate), approving specification ICC 5C Metal barrels or drums of type 304, 316, or 347 stainless steel or other types of stainless steel of equivalent corrosion resistance and physical properties.

Section 73.273 has been amended by the addition of new paragraph (d) permitting specification ICC 17F metal drums (single-trip) for the shipment of sulfur trioxide, stabilized.

Section 73.280 has been added to provide for the shipment of flame retardant compound, liquid. Reference to ICC Regulations should be made by anyone who wishes to ship this material.

Section 73.303 has been amended in order to provide for the transportation of dichlorodifluoromethane and difluoroethane mixtures in ICC specification cylinders.

A new paragraph (m)(4) has been added to section 303 to provide additional small single-trip containers for shipment of refrigerant gases. Reference to the regulations is necessary by anyone contemplating movement of such gases.

Note 8 to paragraph (q)(1) of section 73.303 has been amended to read as follows:

Note 8: For tank cars of other than ICC 106A type, used for shipping chlorine, tests prescribed in paragraph 15 of spec. 105A300 must be made at intervals of 2 years or less and interior pipes of liquid discharge valves must be equipped with check valves of approved design.

The reason for this amendment is to eliminate emergency extension of retest period for certain cars used in the chlorine service.

*(The amendments to the ICC Rules and Regulations will be continued in a subsequent issue.—*EDITOR.)

yourself these questions

✓ what makes red oil RED ?

The answer is color bodies and other impurities which are not removed from the fatty acids by the usual processes such as distillation and filtration. These impurities not only make the Red Oil red, but they give it the strong odor usually associated with this product. In addition, these impurities make the Red Oil unstable in color when heated in processes such as esterification and saponification.

All grades of W. C. Hardesty Co., Inc., distilled Red Oil have these impurities removed in their *regular plant processing*. Our regular Red Oils are not red but amber in color with a very bland odor and maximum stability to withstand high temperatures without discoloration or oxidation. Our best salesman is a sample. Send for yours today, and compare the color with any other commercial Red Oil.

1005 Low Titre Redolene . . Distilled Oleic
3-5°C Titre

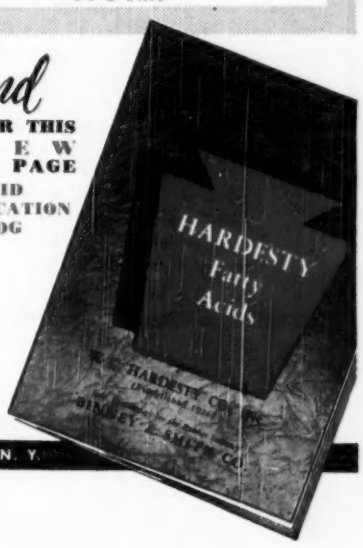
1010 Redolene . . . . . Distilled Oleic
8-10°C Titre

For especially light colored products, we recommend the use of our White Oleic Acid, which is in a color class by itself.

1020 Crystolene (White Oleic Acid)
6-8°C Titre

✓ is distillation of stearic acid enough ?

Since the beginning of the fatty acid industry, producers have relied upon distillation as the means of purifying fatty acids for the production of Stearic Acid.



Distillation is not enough to remove the impurities from the fatty acids. The average commercial Stearic Acid shows this by its relatively dark color, and poor odor and color stability when it is used in making esters and high grade cosmetic soaps and creams.

The W. C. Hardesty Co., Inc., chemists have developed methods of purification of the fatty acids for Stearic Acid production which go far beyond distillation and the purity is guarded through each step in the process of manufacture. This accounts for the excellent color and odor of our Stearic Acids and for the stability of the color and odor when the Stearic Acids are processed in customers' plants.

To produce highest quality esters, soaps and cosmetic preparations, use our Stearic Acids . . . generous testing samples will show you why.

1210 Single Pressed Stearic Acid
1220 Double Pressed Stearic Acid
1230 Triple Pressed Stearic Acid
1240 Supra Grade Stearic Acid

ethylene trithiocarbonate

STAUFFER CHEMICAL COMPANY ANNOUNCES THE AVAILABILITY OF ETHYLENE TRITHIOCARBONATE

(1, 3 dithiolane 2 thione)
(dihydro 1, 3 dithiol 2 thione)

Ethylene trithiocarbonate is a bright yellow to brown crystalline solid depending on the crystal size. It has substantially no odor when pure, but the technical grade may contain traces of mercaptans and other sulphur compounds.

It is suggested for use as a flotation agent, a sulphur solvent, as an intermediate in the manufacture of organic chemicals, and as an ingredient of extreme pressure lubricants. Ethylene trithiocarbonate contains over 70% sulphur and may have value in the vulcanization of rubber. In agriculture there are indications that this product can be used as an aphicide, and scalicide, and perhaps as an intermediate in the manufacture of economic poisons.

Empirical Formula: $C_3H_4S_3$
Molecular Weight: 136.3
Structural Formula:

PHYSICAL PROPERTIES

Empirical Formula	$C_3H_4S_3$
Molecular Weight	136.3
Melting Point	34.5-35.0° C.
Boiling Point	117-118° C. (0.6 mm)
Pounds per gallon (Solid)	13
Flash Point (Tag closed cup)	165.5° C.
Specific Gravity	1.48
Refractive Index, N^{20} (extrapolated)	1.73

Solubility

Soluble: chloroform, ethylacetate, acetone, ethyl ether, benzene, nitromethane.

Slightly Soluble: glacial acetic acid, carbon tetrachloride, ethanol.

Insoluble: water, petroleum ether.

REACTIONS

Hydrolysis: Ethylene trithiocarbonate can be hydrolyzed to dithio ethylene glycol (ethylene dithiol) by reacting with ethanolic potassium hydroxide.

Oxidation: Ethylene trithiocarbonate is said to be oxidizable to ethylene dithiocarbonate.

Chlorination: Ethylene trithiocarbonate can be chlorinated readily. It is probable that the chlorine replaces the thione sulfur and one of the hydrogen atoms.

AVAILABILITY

Inquiries for samples, further data, etc., are invited. Sample quantities of one-quarter pound are available without charge, and additional quantities are available for cooperative evaluation research projects.

NEWS OF THE MONTH

New Construction

• **Acrylonitrile** and related chemicals made directly from acetylene by a new process will be the products of a $30 million expansion at Monsanto Chemical Co.'s Texas City, Tex., plant. Monsanto, which has not previously produced the material, has a special interest in acrylonitrile, for the experimental fiber of Chemstrand Corp., American Viscose-Monsanto subsidiary, is reportedly a copolymer containing 85% acrylonitrile. American Cyanamid Co. has been the only acrylonitrile producer, making it from ethylene oxide and hydrogen cyanide. Other uses of the material are for plastics, Buna-N rubber.

The new facilities, to be built at the styrene manufacturing location, will double the size of the present plant. Construction will begin immediately.

• **Expansion continues to be the word** from Du Pont on nylon. Over 100,000 sq. ft. of floor space will be added to its Martinsville, Va., plant, virtually doubled in 1945-46, to increase size of the spinning, textile, inspection and shipping areas. The company has also taken an option on a 635-acre tract near Kinston, N. C., for its fourth nylon yarn plant. The plant will employ 1,200 people, will take 18 months to complete after construction gets under way.

• **Two new plants** for Permalite, lightweight plaster aggregate, are planned by licensees of Great Lakes Carbon Corp. Perlite Products Corp. will build one in Dallas, Tex.; Virginia Perlite Co., in Hopewell, Va.

• **A three-story process building** and a warehouse comprise a new polyvinyl chloride resin plant to go under construction immediately at B. F. Goodrich Chemical Co.'s growing Avon Lake, O., general chemicals plant. To be completed in mid-1951, the plant will cover seven acres. Girdler Co. is handling engineering and process construction.

• **National Aluminate Corp.'s** Chicago plant is being expanded to house additional drying equipment.

• **Bjorksten Research Laboratories, Inc.,** has bought a 168-acre tract outside Madison, Wis., will erect buildings for new testing units, equipment and laboratories.

• **Two adjoining buildings** for warehouse and sales office space in Atlanta, Ga., will be built by Minnesota Mining & Manufacturing Co. They are expected to be ready for January occupancy.

Francis E. Murphy (left), appointed production supervisor of the Wyandotte works, Pennsylvania Salt Manufacturing Co.; and J. Scott Brown, named chief engineer for the Naugatuck Chemical Division, United States Rubber Co. Mr. Brown will supervise engineering operations in the synthetic rubber plants at Naugatuck, Port Neches, and Borger.

• **A $2¼-million air-conditioned laboratory** will be built by the Continental Oil Co. at its Ponca City, Okla., plant. It will feature an unusual arrangement of completely concealed air-conditioning duct work and laboratory utility lines in common chases. Wigton-Abbott Corp., Plainfield, N. J., has been awarded the contract for its design and construction.

• **The recently completed liquid resin plant** of Catalin Corp. at Calumet City, Ill., will be expanded by two additional processing kettles and necessary auxiliaries. Blaw-Knox Co. will handle design and construction.

• **Du Pont expects** new units for tetraethyl lead antiknock compounds, now approaching completion at its Chambers Works, Deepwater Point, N. J., to be in production before the end of the year. They will raise TEL capacity at that location by one-third.

• **The nation's largest** and most powerful research reactor has begun operating at Brookhaven National Laboratory, Upton, N. Y., nuclear research center supported by the Atomic Energy Commission.

• **Completing construction** on a new $5 million solvent extraction unit at Decatur, Ill., A. E. Staley Manufacturing Co. now has the greatest soybean processing capacity there of any single plant in the world.

• The **Detroit plant and storage facilities** of Quaker Chemical Products Corp., are being enlarged fifty per cent.

• **The world's largest "cat cracker"** will be built by the Gulf Oil Corp. at Port Arthur, Tex. The 60,000-barrels-per-day fluid catalytic cracking unit will be erected there at the company's refinery, will have an output of 20% greater value than that of any similar installation now in operation or under construction. The M. W. Kellogg Co. has been awarded the construction contract. Completion is scheduled for the late summer or early fall of 1951. Cost will be about $8 million.

New Company

• **Four outstanding industrialists and scientists** have aided in organizing a new mutual fund, Growth Companies, Inc., Philadelphia, which will invest in common stocks of companies believed to possess extraordinary growth possibilities. They are Roger Adams, ex-president of the American Chemical Society and president of the American Association for the Advancement of Science; Clyde E. Williams, director of Battelle Memorial Institute; Zay Jeffries, ex-vice president of General Electric Co., and Bayard D. Kunkle, retired General Motors vice president.

Washington

• **Economic Cooperation Administration** hopes to earmark $138 million this fiscal for critical metals and minerals stockpiling. This is about double last year's program.

• **In view of the large surplus** of animal fats, the Government is making a survey to determine the direction of future research on animal fats. John W. McCutcheon, New York consultant, has been given a contract for the survey.

• **Re-activation and operation** of the Government-owned synthetic rubber plant at Louisville, Ky., will be carried out under Reconstruction Finance Corp. contract by Kentucky Synthetic Rubber Corp., a company formed by 10 rubber companies. They are: American Hard Rubber Co., Boston Woven Hose & Rubber Co., Brown Rubber Co., Dryden Rubber Division of Sheller Manufacturing Co., Goodall Rubber Co., Hewitt-Robbins, Inc., Raybestos-Manhattan, Inc., Simplex Wire & Cable Co., Sponge Rubber Products Co., and Thiokol Corp.

• **An increase of 80,000 tons** above the present goal of 600,000 tons of synthetic has been ordered by the White House, and as part of the effort to meet it, one unit in each of the Government's alcohol-butadiene plants at Kobuta, Pa. and Louisville, Ky., is being reactivated.

• **More on synthetic rubber:** the $22 million-government-owned synthetic rubber plant at Torrence, Cal. (annual capacity over 60,000 tons of butadiene rubber) will be re-activated and operated by Minnesota Mining & Manufacturing Co. and Pacific Rubber Co.

General

• **"The South Amboy Port Explosion"** is the title of a report just published by The National Board of Fire Underwriters, New York, N. Y., and the Fire Insurance Rating Organization of New Jersey, Newark, N. J. It discusses possible causes of the catastrophe and suggests a number of safety measures.

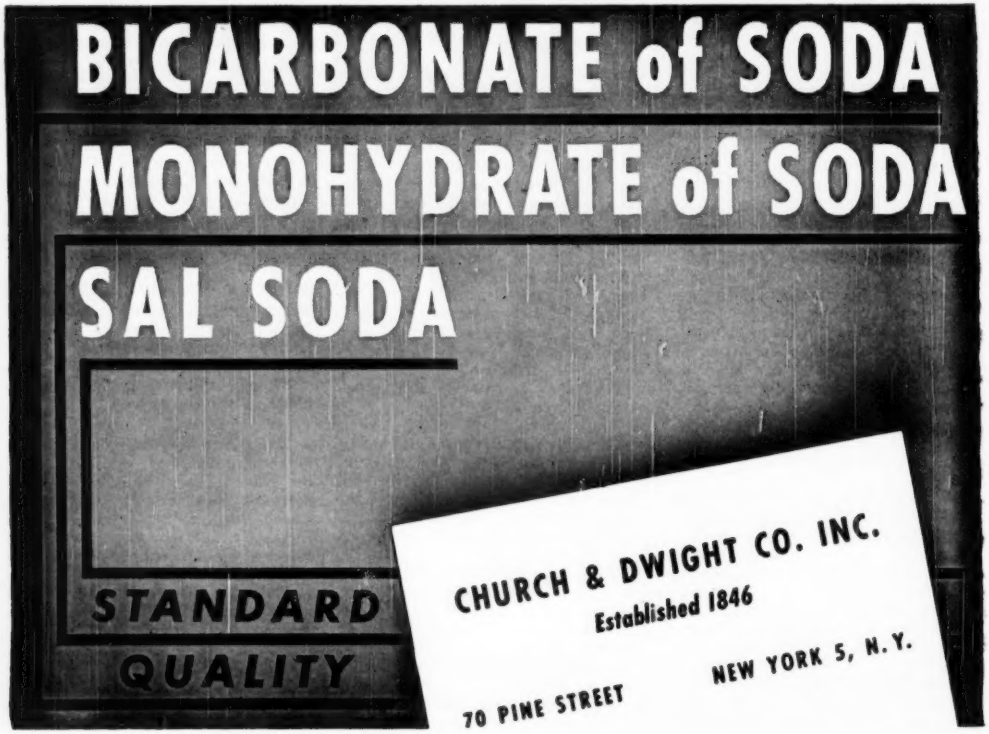
• **First postwar edition** of the Market Guide for the Philippines has just been published by American Foreign Credit Underwriters Corp., New York, N. Y. More than 2,500 leading commercial and industrial firms are listed, with credit and capital ratings.

• **The National Committee for the USA** for the Third World Petroleum Congress Meeting in The Hague, May 28 - June 6, 1951, has been organized with E. V. Murphree, Standard Oil Development Co., N. Y., as chairman and K. G. Mackenzie, The Texas Co., N. Y., as secretary.

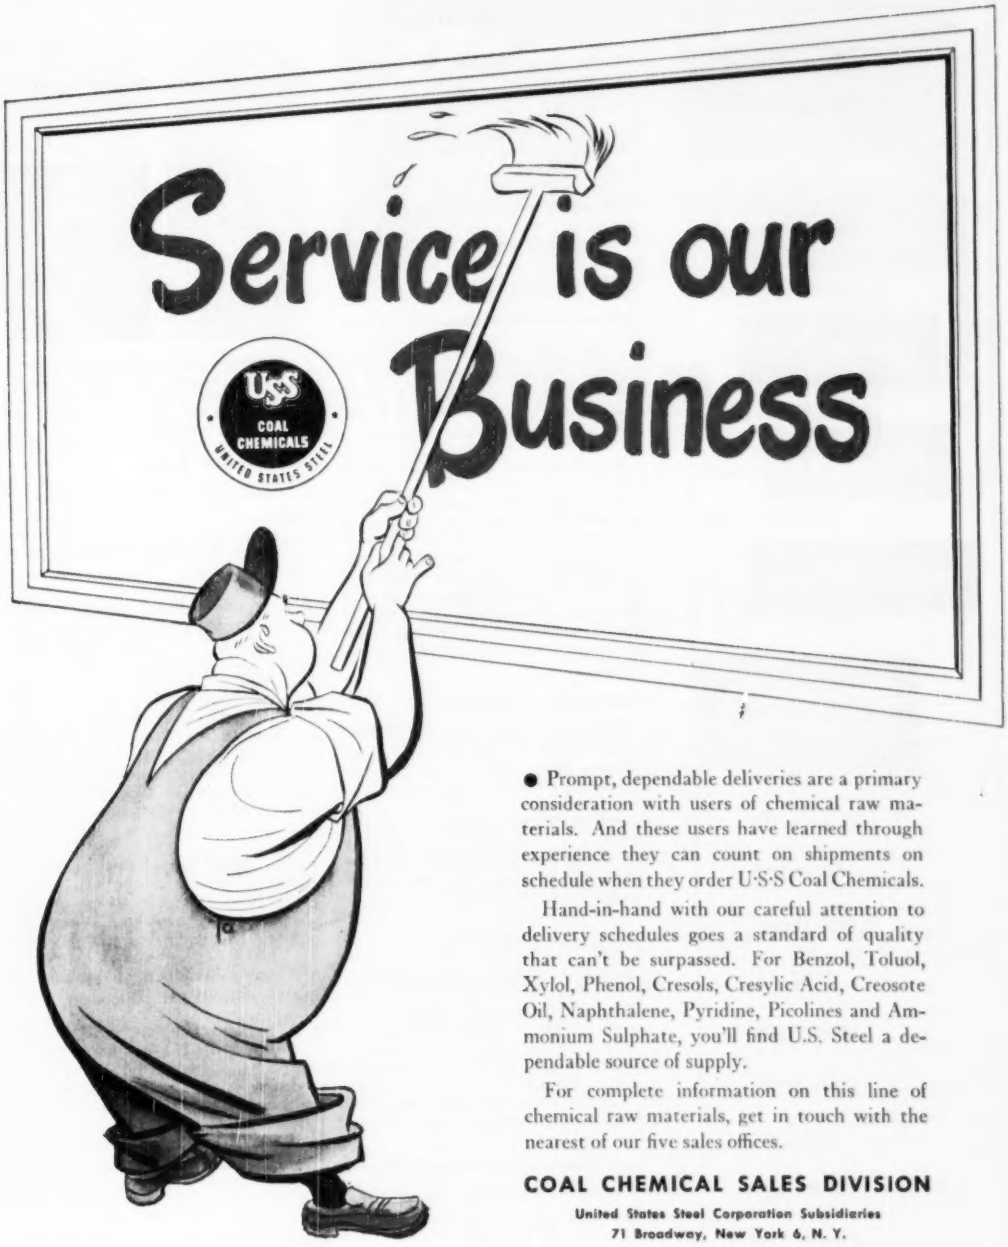
• **The following chemicals** are wanted by Armour Research Foundation, 35 West 33rd St., Chicago 16, Ill.:

Strontium tartrate tetrahydrate
Aluminum triethyl
2-Carboxy-5-n-butyl pyridine
1,3-Dimethyl imidazole
1,5-Dimethyl iminazole
D- or L-Ethyl lactate
1-Methyl-5-cyanomethyl imidazole
Tetramethylhydrazine
3-Hydroxy-N-methylmorphinan
1-(p-Methoxyphenyl)-1,2-epoxypropane
N,N-Dimethylthioacetamide
4-Amino-2-carboxy-1-N-phenyl-4-amino-4'-oxy-1,1'-diphenylmethane
2-Amino-5-nitrothiazole
2-n-Butyl hydroquinone
Triethoxychlorosilane
Carvacrol, pure
Emodin
Fraserin
Phytolaccinum

• **The Air Pollution and Smoke Prevention Association of America** has been reorganized to expand the scope of its activities in stimulating development of ways and means for solving the growing problem of air pollution. Individual, company and sustaining memberships are available. There are also honorary memberships for people eminent in the field of air pollution control.



• **A subject index** to technological documents issued in Vol. 12 of the "Bibliography of Technical Reports" is now available at $1 a copy from the Office of Technical Services, U. S. Dept. of Commerce, Washington 25, D. C.



• **The Office of Basic Instrumentation** has been established at the National Bureau of Standards to coordinate a program of evaluation and improvement of instruments for measuring basic physical quantities.

Foreign Developments

• **India's caustic soda capacity** has been increased 20 per cent by a new caustic soda and chlorine plant, known as D.C.M. Chemical Works, built at Delhi for Delhi Cloth & General Mills, Ltd. by the H. K. Ferguson Co., New York. Annual capacity is 2100 tons of caustic.

• **The continuous spinning process** for rayon yarn production which has been licensed from its developer, In-

● Prompt, dependable deliveries are a primary consideration with users of chemical raw materials. And these users have learned through experience they can count on shipments on schedule when they order U·S·S Coal Chemicals.

Hand-in-hand with our careful attention to delivery schedules goes a standard of quality that can't be surpassed. For Benzol, Toluol, Xylol, Phenol, Cresols, Cresylic Acid, Creosote Oil, Naphthalene, Pyridine, Picolines and Ammonium Sulphate, you'll find U.S. Steel a dependable source of supply.

For complete information on this line of chemical raw materials, get in touch with the nearest of our five sales offices.

dustrial Rayon Corp., has been installed in a new factory at Nijmegen, The Netherlands.

• **In an effort to reduce** her dependence on dollar sources for sulfur, nearly all of which is imported from the United States, Great Britain is exploring the possibility of obtaining sulfur from hydrogen sulfide produced by biological action of sulfate-reducing bacteria such as are frequently found in stagnant lakes.

• **A sixth Cellophane casting machine,** part of a $1.5 million program that will up production of transparent film there 25 per cent, will be installed at the Shawingian Falls, Que., Consolidated Works of Canadian Industries, Ltd.

• **Pan-European Industrial Plant Co.,** Paris, has built a demonstration near Rouen, France, for synthesis gas production based on the process developed by Schmalfeldt for gasifying coal dust. Various lignites and coal are to be tested. The company has signed an agreement with Chemical Construction Corp., of New York, for its gasification process for fuel oil gasification only.

Ownership Changes

• **Will Corp.** has acquired its fifth division with the purchase of E. J. Callahan & Co., Baltimore, and will operate it as Will Corp. of Md.

• **Quimby Pump Division** of H. K. Porter Co., Inc., has been sold to Warren Steam Pump Co., Inc. Porter is withdrawing from the manufacture of screw pumps.

Company Notes

• **Sales of products** manufactured by General Aniline & Film Corp., will now be handled by one organization, General Dyestuff Corp., to which sales of detergents, emulsifiers and chemical specialties, formerly handled by GAF's Antara Products Division, have been transferred. General Dyestuff now consists of a Dyestuff Division, which will sell dyestuffs and textile auxiliaries, and an Antara Products Division handling the non-dyestuff products.

E. E. McSweeney (left), with Battelle Memorial Institute since 1938, will direct relations between Battelle and sponsors in the industry; and Leslie G. Jenness, named assistant to the president in charge of research, Kennecott Copper Corp.

• **Plastics fabrication laboratory research** of The Dow Chemical Co. has been consolidated in a new Plastics Basic Research Group at Midland, Mich.

• **Sales offices for its sodium** have been transferred by National Distillers Chemical Corp. from New York to its plant in Ashtabula, O.

• **In preparation for its role** in national defense, Ferro Enamel Corp. has formed a Mobilization Planning Committee within the company to coordinate Government requests for information on its facilities, personnel, possible production schedules, etc.

• **The entire line** of optical instruments produced in the Carl Zeiss plants are available from Ercona Corp., New York, N. Y., just appointed exclusive American agents.

• **Niagara Alkali Co.** is marking its fiftieth anniversary.

• **A reclaim rubber plant** will be opened by B. F. Goodrich Co. at Akron, O., since this industry is booming in the face of government restrictions on rubber and high prices for crude.

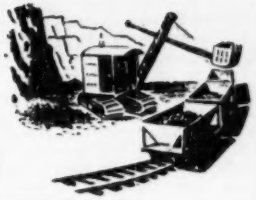
• **Chemical companies** report the following sales and earnings on past operations:

Company	*Sales for Year Ending June 30*		*Net Income for Year Ending June 30*	
	1950	*1949*	*1950*	*1949*
The Davison Chemical Corp.	$34,974,856	$37,350,073	$2,159,536	$2,275,884
International Minerals & Chemical Corp.	58,402,180	53,394,760	5,776,660	5,421,017
McKesson & Robbins, Inc.	367,581,792	356,639,055	8,232,105	8,812,591
Spencer Chemical Co.	19,395,960	15,699,344	4,461,312	3,571,240
	Sales for Six Months Ending June 30		*Net Income for Six Months Ending June 30*	
General Aniline & Film Corp.	$42,351,000	$39,054,000	$3,047,000	$2,756,000
Merck & Co., Inc.	40,318,976	35,189,530	4,850,989	3,530,496

Robert K. Rigger (left), named assistant manager, organic chemical sales, Michigan Alkali Division, Wyandotte Chemicals Corp.; and C. W. French, who has joined Pfister Chemical Works, Inc. Mr. Rigger was previously with U. S. Industrial Chemicals. Mr. French has been manager of phosphorous compounds for Oldbury Electro-Chemical Co.

• **An example of a company's** putting into practice the "Point Four" program, and incidentally expanding the market for its own products, is found in the malaria control program carried out in the Shiraz Valley of Iran by the Pennsalt International Corp., Iran Foundation of New York, and Academy of Natural Sciences of Philadelphia. A three-man American scientific team, assisted by Iranians first trained by the team, has completed DDT spraying of some 145 towns and villages, embracing a population of about 220,000 persons, in the heavily malarial infested district of Shiraz. It also collected entomological data on malaria vectors of the area and trained and equipped Iranian teams to continue the program.

Iran Foundation, a private organization now conducting projects to promote health in the Shiraz Valley, engaged Pennsalt Health and Agriculture Service, a division organized by Pennsalt International to provide scientific knowledge and technical guidance on sanitation and insect pest control through the world. The Academy of Natural Sciences' part in the project was to assign Dr. H. Radclyffe Roberts, a malaria specialist, to accompany the PHAS team to aid in the program. Backed by the facilities of Whitemarsh Research Laboratories of PHAS's parent company, Pennsylvania Salt Manufacturing Co., the initial phase of the program, which was expected to take six months, was completed in 2½ months.



• **Tracking down the cause** of every accident, no matter how slight, is attributed by The Davison Chemical Corp. with reducing accident frequency and severity rates of some of its divisions to as little as 16% and 12%, respectively, of the average for its industry.

• **Commercial Solvents Corp.** has established an annual award of one thousand dollars and a gold medal

Project your Plans

with Abundant

Lithium

and Available

Lithium[F] Compounds

Foote U. S. sources assure year-round supply of Lithium Ores

Lithium Ores are abundant, and high grade workings are geographically located so that even weather is not a deterrent for prompt shipment to Foote for processing.

Foote Productive Capacity assures good delivery of Lithium[F] Compounds

Lithium[F] Compounds for the chemical, ceramic, petroleum, electronic, pharmaceutical, air conditioning, and allied industries are available on good delivery schedules in quantities from carloads, to tons, to pounds as desired. A complete listing of all Foote Lithium[F] Compounds will be sent upon request.

Lithium to the (F)oote Power

Represents the very tangible "added ingredients" contained in every pound of Lithium[F]—the ingredients of practical basic research, advanced production methods, long experience and technically informed personnel. This combination aids you in taking full advantage of the unique, profitable characteristics of Lithium[F]—and these "added ingredients" cost you nothing.

Re-evaluate lithium—just write us.

for outstanding research in antibiotics. The Society of American Bacteriologists will administer the award.

• **Scientific Glass Apparatus Co., Inc.,** has transferred offices and plant to 100 Lakewood Terrace, about a half mile from its former location in Bloomfield, N. J.

• **United Dyewood Corp.** and American Dyewood Co. have moved to 285 Madison Ave., New York, N. Y.

• **An employee and public relations division,** to coordinate all company human relationship activities, has been formed by Wyandotte Chemicals Corp. George H. Baker, recently active with American Potash and Chemical Corp. in similar activities, will head the new division.

• **Stockholders of Allied Chemical & Dye Corp.** have approved the proposed four-for-one split of the common stock. New certificates for Allied stock, to give effect to the split, were mailed on September 1.

• **The B. F. Goodrich Co.** had the best annual safety record in its history last year, and has been granted the Distinguished Service to Safety Award of the National Safety Council.

• **Armstrong Cork Co.,** Lancaster, Pa., is erecting movable steel interiors in its research laboratory to make it possible for offices and individual laboratory rooms to be rearranged to suit the needs of research workers. E. F. Hauserman Co., Cleveland, has been awarded the contract.

• **Buffalo Electro-Chemical Co.,** one of the first manufacturers to make hydrogen peroxide electrolytically in this country, is celebrating its 25th Anniversary.

• **As part of its expanded fellowship program,** the Texas Co. has recently established fellowships at the University of Cincinnati and New York University, bringing to 18 the number of fellowships and grants Texaco has established in institutions throughout the country.

• **Henry Levine & Son, Inc.,** electroplating consultants, has moved its office and laboratory to Jackson Bldg., 153 E. 26th St., New York, N. Y.

• **More than 6800 employees** of Minnesota Mining & Manufacturing Co. received a total of $349,375 as their share in the firm's profits in the second quarter of 1950.

CALENDAR *of* EVENTS

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, annual meeting, Cleveland, O., Dec. 26-30.

- **PROCESS VESSELS**

OPERATING AT VACUUMS, LIMITED BY THE VAPOR PRESSURE OF THE CONDENSATE?

Many stills, dryers, evaporators, crystallizers and other processing vessels are operating at vacua limited by the vapor pressure of the condensate. This means on the average an absolute pressure of about 2.0" Hg. Most owners of such equipment do not realize how practical and economical it is to put a Booster Evactor in the line between the vessel and the condenser and maintain an absolute pressure of 0.5", 0.25" or even lower. The benefits of this higher vacuum in improving quality and capacity are often very substantial.

The steam jet type of vacuum pump has continually gained in favor for high vacuum in industrial process work. The total absence of moving parts is a big advantage and means many years of service, with no maintenance cost. Available in single, two-, three-, four- and five-stage units for vacuum from a few inches up to a small fraction of 1 m.m. Hg. absolute.

Croll-Reynolds have been specializing on this type of equipment for over 30 years, and have made thousands of separate installations. Their engineers have extensive experience in applying it to numerous different processes, and are available for consultation without obligation. Literature is also available on request.

PEOPLE

Company Officers

• R. B. Worthy, vice president of **Mathieson Chemical Corp.,** formerly general manager of both the Saltville, Va., and Baltimore, Md., operations, has been named manager of the Saltville operations where he will make his headquarters. His new responsibilities include supervision of the construction and operation of the new $6-million electrolytic chlorine plant at Saltville.

Arthur T. Bennett, vice president, formerly general manager of SASCO operations, has been appointed general manager of the Baltimore operations.

Both the Saltville and Baltimore operations are considered major units for the defense effort.

• Sidney C. Mills has been elected vice president of **Winthrop-Stearns Inc.,** assigned to administrative operations. He has been administrative assistant to the president and assistant treasurer of the company for the last four years.

• **The Lotte Chemical Co., Inc.,** with offices and plants at Paterson, N. J., has appointed W. J. Kramer as vice president in charge of sales. He was formerly vice president and general

manager of Philipp Brothers Chemicals, Inc.

Joseph Marchand (left), named Canadian divisional manager for Abbott Laboratories; and Milton A. Dewey, appointed head of the newly created tetraethyl lead sales department, Canadian Industries, Ltd. Mr. Marchand was formerly a district manager for Abbott with headquarters in Montreal. Mr. Dewey has been with the Du Pont petroleum chemicals division, and will be responsible for Canadian sales of Du Pont tetraethyl lead compounds.

• Philip A. Singleton has been appointed assistant to Edward A. O'Neal Jr., chairman and managing director of **Monsanto Chemicals Limited** in London, England. He has been located in St. Louis as assistant director of the company's Foreign Department since September, 1949. As assistant to Mr. O'Neal he will take part in the expansion of Monsanto's activities in the United Kingdom and in Europe and assist specifically in regard to operational matters and liaison with the various Monsanto companies.

Production

• Richard P. Carter has been appointed assistant superintendent of the **Hercules Powder Co.** plant at Burlington, N. J. He was formerly chief chemist at the plant.

• Louis W. Munchmeyer has been promoted to assistant general manager of **Ansco.** He joined Ansco a year ago as executive assistant to the general manager.

• H. L. Barnebey has been appointed manager, and Sanford R. Bell process engineer, for the chlor-alkali department of **Blaw-Knox Co.'s** Chemical Plants Division.

• Delbert Van Fletcher has been named asssistant director of the technical division of the Grasselli Chemicals Department, **Du Pont.** He had been process manager in the Manufacturing division.

• **Tracerlab, Inc.,** has appointed Sidney S. Minault as production manager. He was chief production engineer at Ansco.

• The **Dow Chemical Co.** of Midland, Mich.. has appointed A. E.

ACRYLIC MONOMERS

ACRYLATE ESTERS

$CH_2=CHCOOR$

Methyl acrylate
Ethyl acrylate
n-Butyl acrylate*
Isobutyl acrylate*
2-Ethylhexyl acrylate*
n-Octyl acrylate*

ACIDS

Acrylic acid*
(60% aqueous solution)

Methacrylic acid
(90% aqueous solution)

METHACRYLATE ESTERS

$CH_2=C(CH_3)-COOR$

Methyl methacrylate
Ethyl methacrylate
n-Butyl methacrylate
n-Hexyl methacrylate
n-Octyl methacrylate
n-Lauryl methacrylate

A versatile series, these monomers offer possibilities in polymers and copolymers varying from very hard, rigid plastics to very soft, "internally-plasticized," rubber-like materials.

The acrylic monomers can also be used as intermediates for the preparation of a variety of *beta*-substituted propionates and isobutyrates, by the addition of halogen acids, alcohols, phenols, H_2S, mercaptans, ammonia, amines, nitroparaffins, and activated methylene groups. Cyclic esters result from the Diels-Alder reaction with dienes.

*Acrylic acid, n-butyl acrylate, isobutyl acrylate, 2-ethylhexyl acrylate and n-octyl acrylate are development products available in pilot plant quantities. The other monomers are available in commercial quantities.

A technical bulletin reviewing the properties, polymerization, copolymerization, and other reactions of the acrylic monomers is available. For a copy of this literature, as well as samples and prices, write to Dept. SP.

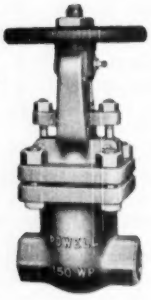
"Window Shopping" for Valves is poor economy

Reading advertisements is like "window shopping"—it's a good way to see what's on the market. But don't let it influence you into buying your flow control equipment from different sources.

Because if you buy all your valves from one source you avoid these pitfalls:

Complications in stocking spare valve parts.



Difficulties that confront the maintenance department in making repairs on a variety of valves.

The necessity of carrying a much larger stock of repair parts.

The chances of installing valves that are not backed by adequate engineering service.

By offering the *only* COMPLETE line of valves available to Industry today, Powell makes this possible. And if you consult Powell Engineers and select the right valve to suit each individual service, your flow control problems are ended.

Fig. 2490 (18-8S, 18-8S Mo, Durimet "20") and **Fig. 2492** (Monel Metal, Nickel, Ampco, Everdur, Hastelloy Alloys A-B-C-D). 150-pound O. S. & Y. Gate Valve with screwed ends and solid wedge. Can be supplied with double wedges. Flanged end valves have face-to-face dimensions conforming to MSS SP-42. Globe valves of this design are also available. →

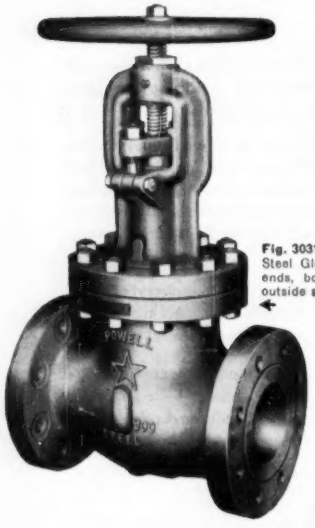


Fig. 3031—Class 300-pound Cast Steel Globe Valve. Has flanged ends, bolted flanged yoke and outside screw rising stem. ←

Fig. 560—200-pound Bronze Regrinding Horizontal Swing Check Valve with screwed ends, screwed-on cap and regrindable, renewable bronze disc.

Fig. 1793—Large 125-pound Iron Body Bronze Mounted Gate Valve. Sizes 2" to 30", incl. Has flanged ends, bolted flanged yoke, outside screw rising stem and tapered solid wedge. →

The Complete Powell Line includes Globe, Angle, "Y", Gate, Check, Non-return, Relief and Flush Bottom Tank Valves in Bronze, Iron, Steel and a wide range of Corrosion-resistant metals and alloys.

Research

• E. F. Degering, formerly of the Chemistry Department of Purdue University and latterly of Armour Research Foundation, has joined the **Miner Laboratories** where he will head a group working on problems of organic synthesis.

• John W. Bodman, for 25 years director of research for **Lever Brothers Co.**, has been appointed technical advisor to the management and board of directors.

• In recognition of his many contributions to science, Herman F. Mark, who is the director of the Institute of Polymer Research at the **Polytechnic Institute of Brooklyn**, is the recipient of an honorary degree, Doctor of Engineering, conferred by the University of Liege, Belgium. The degree was conferred by the Academic Senate of the University at the unanimous proposal of the Faculty of Applied Sciences.

Sales

• John H. Hilldring has been appointed general manager of Foreign Operations in charge of the newly created Export Division of **General Aniline & Film Corp.**

• Franklin T. Peters has been appointed manager of the newly-established Market Development Department, **Heyden Chemical Corp.** He has been with the sales department of Glyco Products Co. Arthur L. Davis, transferred from the Technical Sales Department, will be in charge of New Products Applications.

Died

• **George R. Gibbons**, one of the pioneers in the development of the aluminum industry, and a director of Aluminum Co. of America, September 3, at West Penn Hospital in Pittsburgh. He was 71 years old. Mr. Gibbons, who retired as senior vice president of Alcoa on January 1, 1949, began his career with the company in 1901. His entire business career was spent with Alcoa. In addition to his positions in the parent company, he also held directorships and served as an official of several Alcoa subsidiaries.

• **John Johnston**, who until his retirement in 1946 was director of research for United States Steel Corp., September 12, at the age of 69.

CAN A LOW-COST RESIN EMULSION SOLVE YOUR PROBLEMS?

TRY DU PONT

ELVACET

REG. U. S. PAT. OFF.

A Polyvinyl Acetate Emulsion with these advantages

"Elvacet" emulsion . . . contains colorless, odorless, non-yellowing resin; excellent aging and light-fastness.

Easily applied—requires no costly or flammable solvents.

Uniformly dispersed in water.

Wide latitude in compounding with starches, dextrins, gums, waxes, many synthetic resins, chlorinated rubber, rubber latex and other common types of extenders, pigments and plasticizers.

for these applications

Adhesives and binders for: Cellophane, paper, cardboard, cloth, felt, straw, wood, cork, leather, metal, metal foil, mica, sand, ceramics.

Grease-proof coatings on paper or other materials . . . or grease-resistant sizes.

Rubber latex replacements and modifiers.

Textile finishes: fabric stiffeners, coatings; laminations; hat sizes.

Carriers for insecticides.

For more information about "Elvacet," help in its use for a specific application, samples, etc., send the coupon below. E. I. du Pont de Nemours & Co. (Inc.), Electrochemicals Dept., Wilmington 98, Delaware.

LABORATORY EQUIPMENT

Drying Oven (632A)

Electric oven makes use of new design to promote laboratory safety.

Intended for use in laboratories where there is a possibility of explosion, the new oven contains a specially insulated back which is immediately released in the event of a sudden pressure rise inside the oven. The blowout panel is surrounded by a cage which will prevent its moving more than eight inches from its normal position. Six additional safety factors are incorporated to assure

the safest practicable design and construction in standard type laboratory ovens, without premium prices.

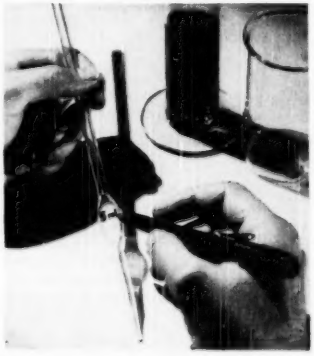
In addition to the normal technical requirements, there is the elimination of hazards due to sparks from electrical connections, high velocity air transfer, low surface temperature of heating elements, auxiliary limit temperature controller, suitable exhaust port, and blowout back panel and guard.

Three sizes and two models are available from The Electric Hotpack Co., Philadelphia, Pa., ranging in size from 2 cubic feet to 20 cubic feet.

Precision Thermostat (632B)

Thermostat provides smooth, continuous control of electric furnace within a very small range at high temperatures.

Dr. Wm. R. Eubank of the National Bureau of Standards has developed a furnace thermostat in which the furnace winding itself serves as the sensitive element, forming part of a bridge circuit for control of a thyratron tube. The thyratron circuit then acts as a continuously variable valve, allowing just enough current to reach the furnace to compensate for a given temperature fluctuation.



The new thermostat is highly sensitive and independent of normal fluctuations in line voltage. Easily adjusted for any temperature, and reliable for periods of continuous operation from a few minutes to several days, it should provide a useful research tool in such fields as metallurgy, ceramics, glass technology, and cement chemistry, where automatic control of furnace temperatures has long been a problem.

• A new instrument for the detection and counting of alpha, beta, and gamma particles is available from the Special Products Div., General Electric Co., Schenectady 5, N. Y.

Called a "universal **scintillation counter**," the device provides low background alpha counting and high efficiency beta and gamma counting. Uses include analytical determination of disintegration rate, and in counting radiation of ore samples.

When used as an alpha counter, the background is not more than a few counts per hour. Counting efficiency is essentially 100% for thin samples. As a beta counter, the device offers several advantages over an end window Geiger Mueller counter. As a gamma counter employing a liquid phosphor, it has a sensitivity many times that of an ordinary Geiger Mueller counter. A standard scaler supplying high voltage is used. When the sample is put in the counting position, particles strike a phosphor causing scintillation which is detected by the photomultiplier tube. (632C)

Marking Pen (632D)

Non-smear marking pen which will mark a 1/16 inch line on any type surface is being manufactured by The Time Savings Specialties Co. of Minneapolis, Minn., for laboratory use.

PERMAS*... the metal made especially for FISHER PERMAS WEIGHTS

No commonly available material matches perfectly all the specifications for analytical balance weights. Permas* was developed especially to conform to specifications prescribed by the Fisher Development Laboratory. Permas is the only metal specifically compounded for analytical weights, and it contains more than 50% non ferrous material.

Permas Weights are manufactured exclusively by the Fisher Scientific Company and Eimer & Amend. They are adjusted to tolerances well within the range required by the National Bureau of Standards.

Permas Weights are harder. The surface resists abrasive action better than brass, bronze, gold, platinum, or any plating used on analytical weights.

Permas Weights are non-magnetic. They will not attract metallic particles and they are not affected by the damping magnets frequently used in analytical balances.

Permas Weights are corrosion resistant. They are not altered by the corrosive fumes often encountered in the laboratory.

Permas Weights are not lacquered or plated. They do not have the disadvantage of taking up moisture as all lacquered surfaces do.

Permas Weights are machined, by tungsten carbide tools, from rolled bar stock and polished to a permanent, durable, mirror-like finish.

*Permas—*permanent mass*—is a coined word, registered in the U. S. Patent Office, and is pronounced per'-mass.

Write for full information on all Fisher Permas Balance Weights.

The 100-gram set of Fisher Permas Weights illustrated at right is adjusted to tolerances required by the National Bureau of Standards for class "S" analytical weights. Price $52.00

YOU CAN SEE WHY

Wyandotte "high-light" Kreelon leaves no residue*

Textile fibers can absorb appreciable amounts of certain detergents which cannot be removed by ordinary rinsing. Also any insoluble material introduced in the processing bath may remain in the fibers.

This residue affects the handle of the fabric. It may affect subsequent finishing operations, alter colors and produce odors.

That's why it's a good idea to use Wyandotte "high-light" Kreelon. This superior detergent dissolves more quickly, is more soluble than most other detergents, and forms no insoluble water hardness complexes. It makes a clear, water-white solution. These qualities may be strikingly demonstrated by dissolving samples of Kreelon and other detergents in separate beakers of water — and holding them up to the light. Note the clarity of the Kreelon solution. Compare it with the hazy, "muddy" appearance of the other detergent solutions.

Kreelon is strongly recommended for textile scouring, dyeing and bleaching operations. It provides excellent detergent, wetting, penetrating, and rinsing properties in hard and soft water, in alkaline and acid media. Its performance is guaranteed by a three-way detergency test. Write us today for complete data on the properties and applications of Wyandotte "high-light" Kreelon.

LATEST manufacturers' booklets and bulletins on products, processes, and equipment. . . . Fill out and send the Readers' Service Card back of magazine for your free copies.

Chemicals

Activated Carbon 635A

10-p. booklet discusses vapor and liquid phase adsorbent applications of granular and pulverized activated carbon. Comparative advantages of each described and uses in decolorization, deodorization purification, isolation, solvent recovery, gold recovery and catalyst and catalyst support. Pittsburgh Coke and Chemical Co.

Alkyl Phenol 635B

Technical bulletin describes properties and uses of alkyl phenol C-9, a mixture of monoalkyl phenols predominantly para substituted. Jefferson Chemical Co.

Organolithium Compounds 635C

60-p. bibliography covers the papers on organolithium compounds in organic synthesis published in 1948 and 1949. Includes papers dealing with the use of lithium metal and some papers covering reactions involving lithium amide. Booklet is supplement No. 1 to "Annotated Bibliography on the use of Organolithium Compounds in Organic Synthesis." Metalloy Corp.

Chemicals from Coal 635D

44-p. booklet describes properties and uses of 58 commodity and specialty chemicals recovered in the coking of coal or derived from coal distillation. Properties of only the pure compounds are presented. Booklet No. T05-500, Koppers Co., Inc.

Chemicals 635E

62-p. booklet lists prices of chemicals available from the G. Frederick Smith Chemical Co.

Bonding Agent 635F

Technical data sheet describes uses, properties and advantages of Rez-N-Bond, a non-inflammable bonding agent for cementing either acrylics or polystyrene. Schwartz Chemical Co., Inc.

Gasoline Dye 635G

6-p. booklet describes properties and uses of oil blue A, a blue gasoline dye especially developed for aviation gasolines. Petroleum Chemicals Div., E. I. du Pont de Nemours and Co., Inc.

Polyethylene 635H

24-p. booklet summarizes the characteristics, development and latest applications of polyethylene resins. Also included is information on methods of fabrication. Bakelite Div., Union Carbide and Carbon Corp.

Collagen 635I

135-p. bibliography on collagen contains 1008 references classified under three main headings: biology, biophysics and chemistry. Eastern Regional Research Laboratory, U. S. Department of Agriculture.

Liquid Resorcinol Resin 635J

Folder describes Cascophen, a liquid resorcinol resin of the cold setting wood type, and contains both household and production gluing instructions. Chemical Div., The Borden Co.

Coating 635K

4-p. bulletin describes properties and advantages of corrosion-proof white enamel. Prufcoat Laboratories.

Gasoline Antioxidants 635L

24-p. bulletin describes gasoline antioxidants Nos. 5, 6, and 22 and their use and application for improving gasoline storage stability. Information on composition and properties and preparation included. Also nomograph and conversion scale for converting antioxidant concentrations. Technical Bulletin AO-50, Petroleum Chemicals Div., E. I. du Pont de Nemours and Co., Inc.

Dimethyl Chloroacetal 635M

8-p. bulletin describes properties and characteristics of dimethyl chloroacetal. Descriptive chart of representative reactions and 41-item bibliography included, as well as data on purification, stability and directions for use. Antara Products, General Aniline and Film Corp.

Chemicals for Textiles 635N

Research Bulletin No. 48 lists previously unpublished German patent applications and research reports and manufacturing processes in the field of textile auxiliaries. The bulletin is divided into 4 sections, Preparation of Intermediates, Processing and Application, New Products and Manufacturing Processes and Team Reports. Research Information Service.

Synthetic Organic Chemicals 635O

16-p. booklet presents data on applications and physical properties of more than 250 synthetic organic chemicals in tabular form. Carbide and Carbon Chemicals Div., Union Carbide and Carbon Corp.

Cadmium Type Stabilizer 635P

Report S-1 describes properties and use of stabilizer No. 40, cadmium type, a light and heat stabilizer for polyvinyl-chloride type resins. Witco Chemical Co.

Cadmium-Barium Type Stabilizer 635Q

Report S-2 describes properties and uses of stabilizer No. 70, cadmium barium type, for polyvinyl-chloride type resins. Witco Chemical Co.

Crotonaldehyde 635R

Bulletin 24 describes physical and chemical properties of crotonaldehyde. Data on current specifications and shipping and handling included. Niacet Chemicals Division.

Polyvinyl Chloride Plasticizers 635S

7-p. technical bulletin discusses plasticization of polyvinyl chloride resins. Suggested formulations given for clear calendered films, plastisols, spread coatings and slush molding compounds. The Baker Castor Oil Co.

Di-tert-Butyl-para-Cresol 635T

13-p. bulletin describes physical and chemical properties, uses and chemical reactions of di-tert-butyl-para-cresol, a crystalline, tr-alkylated phenol which is insoluble in water and aqueous alkali of any strength. Technical Bulletin C-O-115, Koppers Co., Inc.

Textile Lubricants 635U

Bulletin on Ucon textile lubricants for woolens and worsteds presents the results of a two-year testing program and lists the advantages and physical properties of water-soluble wool oils. Form W484, Carbide and Carbon Chemicals Division, Union Carbide and Carbon Corp.

Adhesives 635V

8-p. catalog describes various adhesives, recommends uses, and tells the method of application, as well as listing specifications. Catalog Section 9160 The B. F. Goodrich Co.

Cleaning Agents 635W

4-p. bulletin describes the application for and nature of Chemical maintenance products. Selection chart shows individual maintenance cleaning operations and proper cleaning agent for each. Publication B-1, Fine Organic, Inc.

Adhesive Cements 635X

64-p. book discusses application of adhesive cements and compounds. Charts and illustrations included. Sauereisen Cements Co.

Coating 635Y

2-p. bulletin describes application and use of Granodine for anchoring paint to cold-rolled steel products. American Chemical Paint Co.

Equipment

Pipe and Fittings 635Z

Catalog describes properties and fabrication of saran lined steel pipe, fittings and valves. Photographs, cross-section and dimensional drawings included. Saran Lined Pipe Co.

Worm Gear Speed Reducers 635AA

35-p. booklet describes operation and construction of type AT and RT worm gear speed reducers. Horsepower rating tables and dimensional drawings included. Bulletin No. 130, The Cleveland Worm and Gear Co.

pH Electrodes 635BB

28-p. catalog describes complete line of pH electrodes and assemblies for both industrial and laboratory applications. Advantages of each type of electrode discussed. Photographs and diagrams included. Catalog EN-S5, Leeds and Northrup Co.

Mask Speaking Diaphragm 635CC

2-p. bulletin describes speaking diaphragm for communication between two people equipped with masks or breathing apparatus. Bulletin B-21, Mine Safety Appliances Co.

Laboratory Apparatus 635DD

16-p. booklet describes and illustrates various new laboratory apparatus, including flask with cork insulated top, microscope lampmortar and pestle, and tubular filter made of fritted glass. Scientific Glass Apparatus Co.

Recording Gages 636A

32-p. bulletin describes measuring elements, operating principles, recording charts and accessories for various types of recording gages. Data on instruments for automatic controlling and telemetering of pressure and vacuum values also included. Bulletin G621, The Bristol Co.

Water Hardness Tests 636B

4-p. bulletin describes procedures, reagents and equipment for "one-minute tests" for determining water hardness. Tests may be used to determine total water hardness or hardness due to calcium alone or to magnesium alone. Hall Laboratories, Inc.

Direct Current Recorder 636C

4-p. bulletin describes construction features and use, and gives specifications for portable direct current recorder. Publication No. TP-18-A, Wallace and Tiernan Products, Inc.

Indicating and Recording Thermometers 636D

Folder describes and gives specifications for five different types of thermometers, and for bulbs and fittings. The Electric Auto-Lite Co.

Extruded Plastics 636E

8-p. bulletin explains various forms of plastic extrusions. Data on properties and photographs of components included. Anchor Plastics Co., Inc.

Stationary Air Compressors 636F

8-p. bulletin presents engineering data, sizes and dimensions and gives cross-sectional views of "T" Series stationary air compressors. The series consists of two lines, one designed for pressures of 100–125 pounds and the other rated at 200 pounds for continuous service. Ingersoll-Rand Co.

Ammonia Compressors 636G

Bulletin C-1100-B-36 describes "Y" ammonia compressors, both single and two stage. Specifications and over-all dimensions included. Worthington Pump and Machinery Corp.

Pipeline Anti-Corrosion Tape 636H

4-p. bulletin describes chemical, physical and electrical properties of "Scotch" brand electrical tape No. 22. Pictures on application technique included. Minnesota Mining and Manufacturing Co.

Face Mask 636I

4-p. bulletin describes advantages and design of full-vision face piece. Acme Protection Equipment Co.

Vibrating Feeder 636J

4-p. bulletin describes advantages, operation and construction of mechanical vibratory feeder. Bulletin No. 134, Hewitt-Robins, Inc.

Vibrating Conveyor 636K

4-p. bulletin describes advantages, operation and applications of vibrating conveyor which produces mechanical operation without counterweights. Bulletin No. 135, Hewitt-Robins, Inc.

Turbo-Drive 636L

4-p. bulletin describes advantages and operation of turbo-drive for moving sand or flowable materials vertically or horizontally. Diagram and installation pictures included. Turbo-Drive.

Zeolite Softeners 636M

4-p. bulletin describes features of zeolite softeners. Tables on specifications, dimensions and capacities and diagrams included. Publication 4805, Cochrane Corp.

Separators and Filters 636N

8-p. bulletin describes equipment for removal of water, oil and pipe scale from compressed air systems: cyclone separators, poro-stone air filters and after-coolers. Tables of prices and dimensions included. R. P. Adams Co., Inc.

Casters and Trucks 636O

36-p. catalog describes line of industrial casters, platform trucks, and hand trucks. Data on construction and complete specifications included, and items are illustrated. The Rapids-Standard Co., Inc.

Bleaching Process 636P

Bulletin describes cold steep bleaching process in which hydrogen peroxide is the active bleaching agent. Equipment and procedure fully discussed. Buffalo Electro-Chemical Co.

Relative Humidity Test Chambers 636Q

4-p. bulletin describes performance and construction and gives specifications for relative humidity test chambers which are mechanically refrigerated. Bowser, Inc.

SO_2 Recording or Controlling Equipment 636R

4-p. bulletin describes operating and design features of Micromax SO_2 recording equipment and Micromax electric or pneumatic control. Specifications included. Folder N-91(la), Leeds and Northrup Co

Flowrator 636S

24-p. bulletin describes features, construction and operation of Series 700 flowrator. Diagrams and installation suggestions included. Catalog Section 25-E, Fischer and Porter Co.

Boiler Feed Water Treatment 636T

6-p. bulletin discusses development, operation, and application of Hot-Z system for treating boiler feed water. Bulletin W-212B7, Worthington Pump and Machinery Corp.

Pressure and Temperature Regulators . . 636U

32-p. booklet describes and gives capacities, flow data, weights and dimensions for pilot-operated pressure and temperature regulators. Pictures, charts and tables included. Spence Engineering Co., Inc.

Materials Handling 636V

32-p. catalog describes materials handling equipment such as casters, conveyors, floor trucks, lift trucks and skid-platforms. Market Forge Co.

Miscellaneous

Chemical Consultants 636W

20-p. booklet describes facilities and equipment of Foster D. Snell, Inc., and discusses reasons for using a consultant.

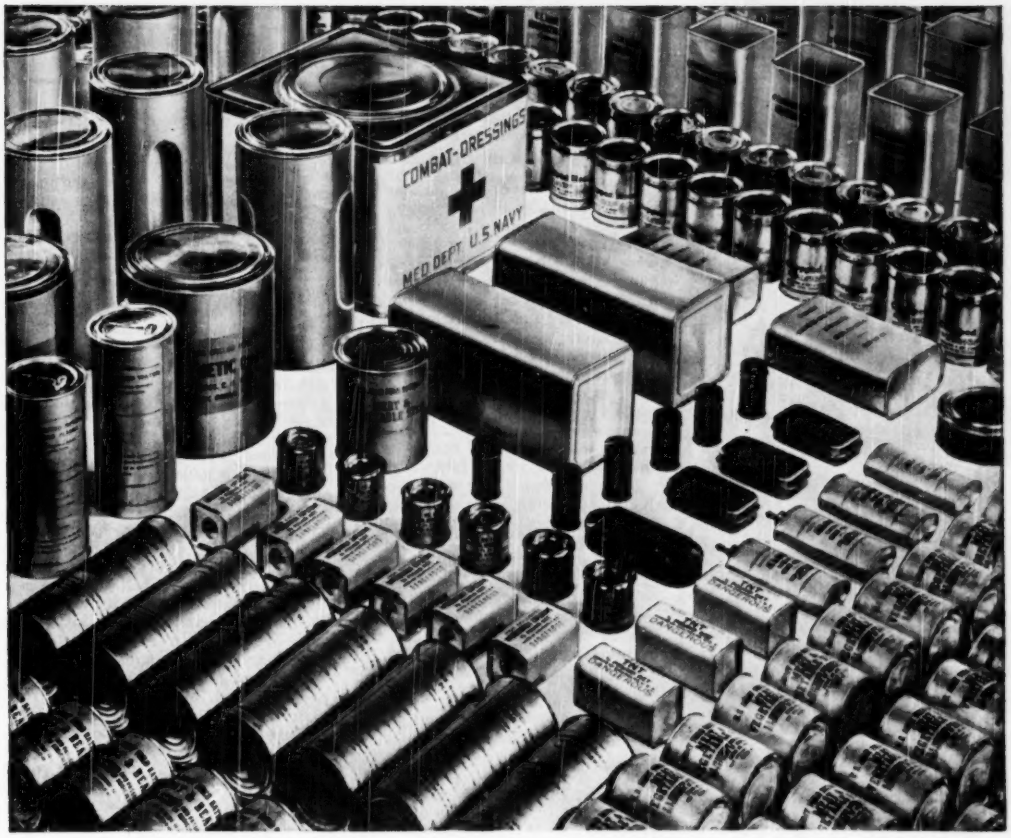
Electroplating School 636X

Bulletin describes correspondence course given by Joseph B. Kushner Electroplating School.

Safety 636Y

4-p. reprint "Labor-Management Cooperation for Safety" discusses principles approved by the President's conference on Industrial Safety.

Paper Mill Wastes 636Z



46-p. booklet deals with bacteriological studies of stored Kraft paper mill wastes for the purpose of decreasing stream pollution as well as lower the cost of waste disposal. Series 19, Engineering Experiment Bulletin. Louisiana State University.

Wiser Use of Wood 636AA

36-p. booklet describing the history and work of the U. S. Forest Products Laboratory. Employees' Assoc., Forest Products Laboratory.

Low Temperature Effects 636BB

62-p. publication treating the effects of low temperatures on the properties of materials such as metals, plastics and rubbers. Special Technical Publication No. 78, American Society for Testing Materials.

Did you pack any of these?

During World War II, our customers packed an astonishing variety of products in Canco containers for military use . . .

. . . Containers for field rations . . . blood-plasma transfusion kits . . . first-aid kits . . . TNT . . . land mines . . . demolition kits . . . and many other war items.

Canco was able to solve many unusual packaging problems, produce essential containers quickly, and in great numbers. This was because our years of experience had given us "know-how" unequalled in the industry.

Should you need this "know-how" today on packaging a product for military use, we shall be glad to consult with you.

CANCO

AMERICAN CAN COMPANY

New York · Chicago · San Francisco

SINCE the early 1900's we have been developing and building increasingly efficient closing machines and auxiliary and related equipment for lease to container users.

As of January 1, 1951, this entire line will be made available for sale as well as lease.

Details will be available shortly through our division offices in New York, Chicago and San Francisco.

CHEMICAL MARKETS

Chemical Production Lowered by Ash Strike

Production levels of industrially important inorganic chemicals were generally lower in July than in June 1950. However, in most cases they were higher than for July 1949. Production decreased over that of the previous month for 21 of 37 chemicals listed by the Bureau of Census while increases were chalked up for 15. However, reductions in the production of at least six of these chemicals can be attributed directly to the long strike which began at the soda ash plants of one of the producers and spread to the plant of another a few weeks later.

After reaching a non-seasonal production peak in May, sulfuric acid finally began the normal summer slump abetted by another sharp drop in production of synthetic ammonium sulfate and a sharp decrease in superphosphate.

Natural soda ash production was pushed to new high levels by the extraordinary demand created by the unavailability of ammonia-soda ash.

Styrene Continues Upward Push

Despite the critically short supplies of benzol, production of monomeric styrene continues to reach new high levels—over 43 million pounds for June of this year. Stimulus for this increase is the continually increasing demand for styrene for synthetic rubber and the apparently insatiable demands for polystyrene by injection molders. In the face of this critical need for benzene nearly 500,000 gallons of motor-grade benzol were produced in June of this year but it is probable that this amount will disappear in the near future. Tar distillers again ceased making this grade of product in June and coke oven operators decidedly reduced its production over that of previous months.

Potash Deliveries at New High

Potash deliveries during the second quarter of 1950 in North America by the five major American potash producers and three importers totaled 693,247 tons of potash salts containing an equivalent of 392,687 tons of K_2O, a new high, the American Potash Institute reports. It represented an increase of 16% in salts and 21% in K_2O over the tonnage delivered during the corresponding period in 1949. Imports comprised 57,044 tons K_2O in the above and included those from France and Western Germany during the entire first half of 1950.

Deliveries for chemical purposes amounted to 32,896 tons of salts, equivalent to 20,402 tons of K_2O. Deliveries for agricultural purposes in the United States, Canada, Cuba, Hawaii, and Puerto Rico (Institute countries) amounted to 652,939 tons of salts equivalent to 367,820 tons of K_2O, consisting of 331,007 tons as muriate, 2,086 tons as manure salts, and 34,727 tons as sulphate of potash and sulphate of potash-magnesia. Exports to other than Institute countries totaled 4,465 tons K_2O.

During the first six months of 1950, total North American deliveries including imports amounted to 1,115,737 tons of salts containing an equivalent of 633,256 tons K_2O.

The chemical industries took 62,877 tons of potash salts containing an equivalent of 39,034 tons af K_2O, a 16% increase over the first half of 1949. Deliveries of potash for agricultural use in Institute countries totaled 1,037,391 tons of salts with an equivalent of 584,923 tons of K_2O, a decrease of 6% in salts and an increase of 1% in K_2O over last year. Making up these agricultural deliveries were 530,492 tons K_2O as muriate, 2,788 tons K_2O as manure salts, and 51,643 tons K_2O as sulphate of potash and as sulphate of potash-magnesia.

Sulfur Stocks Up

The domestic sulfur industry produced 487,845 long tons of native sulfur during the month of June, 1950, according to reports of producers to the Bureau of Mines, United States Department of the Interior. This was a new high for production in a single month and brought total production for the first 6 months of 1950 to a record of 2,543,443 long tons. Mine shipments dropped to 418,502 long tons.

Apparent sales were calculated at 407,404 long tons. For the first time in many months producers' stocks increased, and at the end of June, stood at 2,956,333 long tons at mines, in transit, and in warehouses. The increase continued the following month when stocks increased an additional 19,594 long tons. Production for July was 466,063 long tons.

Citric Acid Price Freeze

In an unusual move the price of citric acid this month was frozen for a period of one year by Chas. Pfizer & Co. In price-stabilization move, the company guarantees not to raise the price before August 31, 1951.

now you can ship molten sulphur in a GATX TANK CAR

The GATX molten sulphur car is a typical example of General American's continuous research and development for the chemical industries. This car makes it possible, for the first time, to ship sulphur in a molten state. Slow, expensive solidifying and re-liquefying at origin and destination are no longer necessary.

Pour molten sulphur (approximately 305° F.) directly into this newly developed GATX car.

At destination, unload directly into the manufacturing process.

6-in. insulation retains heat. Heater coils in the GATX molten sulphur car permit unloading of hot liquid sulphur. From the car it goes to the burners for processing.

bulk shipping keeps pace with chemical progress

Market Review

For the first time in nearly four months a bright spot appears on the soda ash and soda ash-derived chemical horizon. Settlement of the Solvay strikes at Syracuse and Baton Rouge will probably provide a pattern for the settlement of the strikes at Solvay's Detroit plant and at Diamond's Painesville unit. Many feel that these long strikes have so unbalanced the supply-and-demand position of soda ash that new capacity will be called for much sooner than the industry had anticipated. And any totally new capacity will require a much higher price for ash. One first step will be to stop the causticization of soda ash as fast as rayon-makers will permit. During the strike the price of soda ash was increased 20¢ per hundred pounds for light ash to a level of $2.40 per hundred, the second increase this year.

Gum turpentine has advanced sharply in the past month from 49¢ per gallon to 87¢ per gallon. Many in the trade feel that further advances are in store as foreign demand remains strong and supplies are somewhat limited. Further point for worry: If prices increase much more it is expected that serious inroads will be made as use of lower-cost petroleum thinners increases.

Shutdown of one carbon tetrachloride plant by the alkali strike has made a serious dent in the supply. Resellers have been asking as high as 18¢ per pound, ten cents above the usual 8¢ figure.

Billing practices of a number of specialty producers have changed. Bills are now being rendered with the price of the date of shipment rather than with the price of the date that the order was placed. The change was attributed to the current tight market for chemicals and the rapid changes in price that have occurred over the past few months.

Carnauba wax has scored another advance, from $1.12 per pound to $1.15.

Manufacturers of plastic film have introduced voluntary allocation of their production. Some in the trade attribute this primarily to a chlorine shortage. However, the Diamond and Solvay strikes shut down only about 8% of the total chlorine production capacity—one vinyl chloride plant was shut down completely. Thus it would appear that much of the shortage might best be attributed to a combination of short chlorine supplies and a continually increasing demand. One company has raised the price of their vinyl resins from 34 to 36¢ per pound. At the same time the basic price of polyethylene resins was increased two cents per pound to 46¢.

Glycerin and the glycols advanced again this month under the pressure of heavy demand. Soap lye glycerin hopped nimbly from 35 to 50¢ per pound; propylene glycol moved from 16 to 17½¢ per pound; ethylene glycol from 14½ to 16¢ per pound. At the same time ethylene oxide moved up from 16¾¢ per pound to 18¼¢.

Nearly all types of metallic compounds have joined the upward price movement: Antimony trichloride moving up from 29 to 34¢ per pound; lead acetate from $21 to $22 per hundredweight; nickel acetate from 53 to 57¢ per pound; stannous chloride from 70½ to 75¢ per pound; zinc borate from 17½ to 18½¢ per pound.

Short supplies of benzol have put an especial pinch on plastics supplies. There is adequate capacity, for the moment at least, for styrene monomer and supply-and-demand appear to be in balance. The difference in U. S. benzol supplies and needs is being met with high imports and equally high prices. The large user can average out his cost of production with the usual coke oven product. But this course is not open to the small user who has depended upon the spot market. He now is at the mercy of a merciless resale market.

Other advances include liquid chlorine from $51 to $54 per ton and rayon-grade caustic from $2.50 to $2.65 per hundredweight for the 50% solution.

Methanol is in short supply as antifreeze canners stock up for the next season. Completion of the season should see methanol return to the long position which it has held for several years. Formaldehyde, much of which is derived from methanol, has advanced from 3.7 to 4.2¢ per pound; paraformaldehyde from 13 to 13½¢ per pound; hexamethylene tetramine from 22 to 23¢ per pound.

The penicillin supply situation has been changed by the Korean War from a very soft buyer's market to a seller's market. Foreign buying is heavy because of the fear that war might reduce U. S. exports.

Despite settlement of the alkali strike, supplies of bleached pulp are expected to remain short for the remainder of the year. The strike-lowered supplies of chlorine will make it difficult to meet requirements for the rest of the year.

COMPARE *these qualities with other* FATTY ACIDS

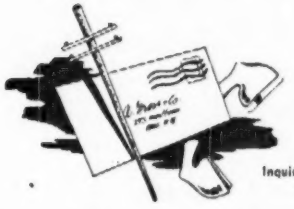
COCONUT FATTY ACIDS — Where uniform Lauric Acid content is desired, A. Gross' Coconut Fatty Acids are your assurance of quality. Manufactured to specifications in two grades:

Regular Coconut Fatty Acids—with no fractions removed.

Special Coconut Fatty Acids—with most of the capric and caprylic fractions removed.

Of interest to manufacturers of cosmetics, shampoos, condensates, alkyd resins.

COTTONSEED FATTY ACIDS — Distilled and double distilled grades for light colored alkyd resins.



MANUFACTURERS SINCE 1837

SPECIFICATIONS

	SPECIAL	REGULAR
Titre °C	26° — 28°	22° — 25°
Color 5¼" Lovibond Red	1 — 3	1 — 3
Color 5¼" Lovibond Yellow	8 — 12	8 — 12
Color—Gardner 1933	2 — 4	2 — 4
Unsaponifiable %	0.25— 0.50	0.25— 0.50
Saponification Value	252 —259	261 —270
Acid Value	251 —258	260 —269
Iodine Value	8 — 14	6 — 12

ADVANTAGES

√1. Uniform Lauric Acid content.
√2. Made in two grades—unfractionated and fractionated.
√3. Ideal for cosmetics, shampoos, condensates, alkyd resins.
√4. Colors as light as 1 Gardner 1933.

Oil and Water do mix

. . . . . with the help of an

ANTARA®

SURFACTANT

Many "unmixable" combinations are readily combined—to form stable and uniform fluids, lotions, creams or sprays—with the help of a **SURF**ace **ACT**ive **AGENT**. The new, or improved products, act more quickly —more thoroughly—or for a longer period of time. They are thus easier to sell; they frequently cost less to make.

Some thirty industries—including the rubber, petroleum and textile fields—have profitable uses for Antara surfactants.

Extensive research staffs and facilities support the development and application of Antara surfactants—available to help you improve an existing product or develop a new one. Your inquiry is invited—without obligation. It will bring a prompt opinion as to whether one of the Antara surfactants may be adaptable to your needs. Kindly address your inquiry to Department 55.

NEW U. S. PATENTS

A complete digest of recently issued patents of special interest to the chemical process industries, conveniently categorized by major fields.

Printed copies of patents are available from the Patent Office at 25¢ each. Address the Commissioner of Patents, Washington, D. C., for copies and for general information concerning patents or trademarks.

U. S. Patents from Official Gazette—Vol. 635, No. 1 (June 27) and Vol. 636, Nos. 1, 2, 3 (July 4-18)

*Polymers**

Polymeric amino alcohol composition prepared by subjecting a copolymer of a vinyl t-hydroxy ketone and a polymerizable open chain having at least one vinyl group, ammonia and a hydrogenation catalyst. 2,510,108. Publicker Industries Inc.

Aqueous polyvinyl acetate emulsion containing water, water soluble polyvinyl alcohol, and glyoxal. 2,510,257. E. I. du Pont de Nemours & Co.

Polymerization of monomeric mixtures of a chloroethylene and another copolymerizable unsaturated compound in aqueous medium in the presence of an ionizable silver compound. 2,510,426. B. F. Goodrich Co..

Preparation of a furfurylated alkyl urea ether resin by heating under alkaline conditions an alkyl ether of dimethylol urea with furfuryl alcohol in the presence of an alkaline catalyst. 2,510,496. American Cyanamid Co.

Polymers and copolymers of unsaturated triazines. 2,510,503. American Cyanamid Co.

Polythioesters prepared by the condensation of at least one acid chloride of a dibasic acid and at least one dimercaptan. 2,510,567. Wingfoot Corp.

Ether-carbonates and polymers. 2,510,600. Wingfoot Corp.

Passing boron trifluoride through a solution of acenapthylene and adding a non-solvent to the resulting solution to obtain a high molecular weight polymer of acenaphthylene. 2,510,647. General Electric Co.

Dry thermosetting composition—a urea-formaldehyde reaction product and ethylene glycol bis-(benzenesulfonate), as a curing catalyst. 2,510,762. Libbey-Owens-Ford Glass Co.

Composition of matter comprising a synthetic linear polycarbonamide. 2,510,777. E. I. du Pont de Nemours & Co.

Preparing tough, orientable polyvinyl fluoride from monomeric vinyl fluoride and a liquid polymerization medium in the presence of an organic azo compound. 2,510,783. E. I. du Pont de Nemours & Co.

Producing a hard resin which is substantially alkali-resistant, insoluble in drying oils and aliphatic hydrocarbons and resistant to petroleum base greases by reacting phenol with formaldehyde in aqueous solution in the presence of an alkaline catalyst to produce a drying oil-insoluble condensate; dissolving the condensate and a liquid monohydric alcohol ester of a rosin acid in a mutual solvent which is sufficiently volatile to permit its separation from the resin ultimately formed; heating the solution until the ester has reacted substantially with the condensate to provide a hard clear resin. 2,510,837. Hercules Powder Co.

Ethyl cellulose-phenol modified coumarone-indene lacquer for polystyrene. 2,510,851. Dow Chemical Co.

Amine-epoxy-phenol compositions. 2,510,885. Devoe & Raynolds Co., Inc.

Copolymer of maleic acid anhydride, chloromaleic anhydride, dimethyl maleate and a compound having the formula, $CH_2=CH\text{-}(CH_2)_7\text{-}CH_2\text{-}X$ (where X is selected from the group consisting of -COOR, -COR, -CONRR', and -CN and R and R' are selected from the group consisting of hydrogen and an alkyl radical containing more than 5 carbon atoms). 2,510,902. Hercules Powder Co.

Adhesive composition for bonding polymonovinylaromatic resins to solids; consisting of a polymonovinylaromatic resin and a liquid triarylphosphate, dissolved in a chloroaliphatic hydrocarbon. 2,510,908. Dow Chemical Co.

Condensation of formaldehyde with ketones and nitroparaffins. 2,510,914. Hercules Powder Co.

Hydrogenated condensate of 10-hendecanoic acid and maleic anhydride and esters thereof. 2,510,915. Hercules Powder Co.

Resinous reaction product of formaldehyde with 2,5-diamino-1,3,4-thiodiazole. 2,510,935. Libbey-Owens-Ford Glass Co.

Condensation product of formaldehyde, a phenol, and a ketone-amine condensate. 2,511,063. Monsanto Chem. Co.

Copolymer of hexafluorocyclobutene and a polymerizable monomeric ethylenically unsaturated compound having a terminal carbon-to-carbon double bond. 2,511,258. E. I. du Pont de Nemours & Co.

Codehydration products of halogen hydrolysis only of an inorganic silicon halide. 2,511,296. ½ to Montclair Research Corp. and ½ to Ellis-Foster Co.

Preparing organo silicon polymers by blowing dry air through an alkoxy silane until a soluble polymerized resinous material is obtained. 2,511,297. ½ to Montclair Research Corp. and ½ to Ellis-Foster Co.

Polymeric compounds from hydrocarbon silane diols and polyisocyanates or polyisothiocyanates. 2,511,310. E. I. du Pont de Nemours & Co.

A chlorinated polymerized ester formed from acrylic acid and a straight chain monohydric alcohol higher than propyl. 2,511,424. Pierce Lab., Inc.

Polyperoxide catalysts in ethylene polymerization. 2,511,480. E. I. du Pont de Nemours & Co.

Diol-diisocyanate high molecular polymerization products. 2,511,544. Attorney General of the U.S.

Plastic composition comprising a homogeneous mixture of a normally solid synthetic organic polymer and a plasticizer; the plasticizer being a non-resinous ester of Diels-Alder adduct of anthracene and an alpha, beta ethylenically unsaturated carboxylic acid and a monohydric aliphatic alcohol. 2,511,577. Neville Co.

Producing a granular vinyl chloride polymer by bringing together liquefied monomeric vinyl chloride or mixtures of vinyl chloride and about 5% of vinylidene chloride or alkyl methacrylate, with an indifferent liquid medium consisting of water and such water-soluble catalysts as alkali-metal persulfates, ammonium persulfate and sodium peracetate. 2,511,593. United States Rubber Co.

Preparing chlorinated butadiene polymers by coagulating synthetic rubbery polymer from a latex formed by emulsion polymerization of a material selected from conjugate diolefin hydrocarbons, halogen-substituted conjugate diolefins, and mixtures of styrene, acrylonitrile, or acrylic esters with conjugate diolefins or halogen-substituted conjugated diolefins. 2,511,605. Hercules Powder Co.

Polymeric ester of Δ3,5-cyclohexadiene dicarboxylic acid-1,2 and glycol. 2,511,621. California Research Corp.

Preparation of granular polymerization products of vinyl chloride and vinyl bromide while dispersed in an aqueous medium having dissolved as a dispersing agent a heteropolymer of vinyl acetate and maleic acid or maleic anhydride. 2,511,811. Monsanto Chemical Co.

Resins of alkyl-substituted cycloalkanol esters of acrylic acids. 2,511,880. U.S.A. as represented by the Secretary of Agriculture.

Aqueous dispersion of glycolphthalate-adipate. 2,511,895. E. I. du Pont de Nemours & Co.

Fireproof and insulating hardenable plastic composition—calcined magnesite, vermiculite, wood flour, silica flour, and a plasticizing solution including magnesium sulfate, citric acid, magnesium chloride and water. 2,511,904. Carl F. N. Clasen and Jennie M. Hummer.

Resinous epoxides and aromatic amine aldehyde condensates. 2,511,913. Devoe & Raynolds Co., Inc.

Producing a resinous polymeric material by reacting zirconium n-butylate with tri-hexyl phosphate. 2,512,063. Ferro Enamel Corp.

---

* From Vol. 634, Nos. 4, 5; Vol. 635, Nos. 1, 2, 3.

Production of an alkyd resin by heating a linear homopolymer of allyl acetate with diethyl phthalate and sodium ethylate and removing the formed ethyl acetate by distillation. 2,512,410. Shell Development Co.

Hosepipe of drawn, heat set filamentous highly polymeric linear esters obtained by heating glycol with terephthalic acid, and ester forming derivatives of terephthalic acid. 2,512,433. Imperial Chemical Industries Ltd.

Uniformly pigmenting tough, solid ethylene homopolymer by mechanically working dry a finely-divided, difficultly dispersible pigment into a hydrocarbon wax and thereafter mixing the wax-pigment dispersion with fused ethylene polymer. 2,512,459. E. I. du Pont de Nemours & Co.

Flattening agent—a methyl cellulose coated metallic salt of a raw, non-pyrolized Manila gum resin, the metal being one from the group consisting of aluminum, magnesium, calcium, strontium, barium and zinc. 2,512,470. Interchemical Co.

In preparing vinyl polymers by subjecting a liquid vinyl ester of a monocarboxylic acid to polymerization, the step comprising adding styrene or alkyl substituted styrene to the polymerization reaction after partial polymerization, whereby the reaction is terminated. 2,512,472. E. I. du Pont de Nemours & Co.

*Rubber**

Synthetic rubberlike materials by compounding a polymerized alkyl acrylate resin with a vulcanizing agent comprising a quinone derivative together with a lead oxide and heating until vulcanization is effected. 2,509,513. U.S.A. as represented by the Secretary of Agriculture.

Manufacture of synthetic rubber by adding water suspension of hydrophilic carbon black, to the latex of a rubber-like copolymer, thereby producing a stable dispersion without coagulation; then precipitating the rubber-like copolymer with the dispersed carbon black by acidifying the mixture. 2,509,664. Godfrey L. Cabot, Inc.

Composition of asphalt and a butadiene-acrylonitrile copolymer adherent to asphaltic surfaces and resistant to deleterious softening by petroleum oils. 2,509,777. Shell Development Co.

Producing raw unvulcanized butadiene-1,3 hydrocarbon polymer by admixing a synthetic latex prepared by the polymerization of a butadiene-1,3 hydrocarbon in aqueous water-soluble soap emulsion, with a clay and an electrolytic coagulating agent which converts the soap into water-insoluble material and thereby irreversibly coagulate the latex. 2,510,370. B. F. Goodrich Co.

In processing of a predominantly linear chain polymer prepared from isobutylene and a C_4-C_8 conjugated diolefin, the steps of adding to the polymer 0.1 to 1% of a C_8 to C_{12} alkyl mercaptan and milling to reduce the viscosity of the polymer. 2,510,808. Standard Oil Development Co.

In an aqueous emulsion polymerization process for the production of rubbery materials wherein a conjugated diolefin of 4 to 6 carbon atoms is copolymerized with acrylonitrile, styrene or vinyl methyl ketone, the improvement which comprises adding to the polymerized emulsion an aqueous suspension containing a stabilizing agent selected from beta naphthylamine and dibetanaphthyl p-phenylene diamine, an alkanol of 2 to 4 carbon atoms, a colloidal clay and an emulsifying agent selected from gum arabic and casein. 2,510,882. Standard Oil Development Co.

Preservation of rubbery polymers by derivatives of ketone amines. 2,511,064. Monsanto Chemical Co.

Heat-sensitizing of ammoniated latex for manufacturing molded articles. 2,511,722. Societe a Responsabilite Limitee dite: Societe Auxiliaire de L'Institut Francais du Caoutchouc.

*Specialties**

Alginic acid sulfate anticoagulant. 2,508,433. Wyeth Inc.

Compound for forming a waterproof paste for sealing concrete walls—ammonium alum, magnesium sulphate, potassium bitartate, sodium chloride, ground sand, calcium sulphate, and Portland cement. 2,508,480. Harry L. Ainsworth.

Soldering flux composed of zinc chloride, a wetting agent selected from sodium lauryl sulphate and a sodium alkyl aryl sulphonate, water and powdered solder held in a stable suspension. 2,508,501. Armand Di Giulio.

Dichloro aluminum aminoacetate hydrate deodorant composition. 2,508,787. Chattanooga Medicine Co.

Cleaning composition—kerosene, an organic amine soap, o-dichloro-benzene, a lower aliphatic diamine, ethylene glycol monobutyl ether, and water. 2,509,197. Shell Development Co.

Recovery of valuable materials from spent adsorbent employed in the refining of fats and oils (containing oleaginous and nonfatty material, including color bodies), by extraction with a liquefied normally gaseous hydrocarbon solvent. 2,509,509. Swift & Co.

Nonflammable hydraulic fluid—hexachlorobutadiene, polymerized ester of methacrylic acid, glycidyl cyclohexyl ether, and tricresyl phosphate. 2,509,620. Shell Development Co.

Corrosion preventing compositions—a light liquid hydrocarbon, an oxidized waxy hydrocarbon, a mixture of alkaline earth metal salts of organic sulfonic acid and a non-aromatic alcohol. 2,509,786. Shell Development Co.

In preparation of yeast-raised bakery products, decreasing rate of staling by mixing into the dough a small amount of reaction products of a polyhydroxy compound and an alkylene oxide which have been partially esterified with a straight chain monocarboxylic acid or reaction products of an alkylene oxide and a partial ester of a polyhydroxy compound and a straight-chain monocarboxylic acid. 2,509,926. Dedicated to the People of the U. S. A. by R. T. Vanderbilt Co., Inc.

In preparation of starch-containing, yeast-raised bakery products, the improvement which comprises incorporating a polyoxyethylene monoester of a higher fatty acid in the dry mix. 2,509,927. Dedicated to the People of U.S.A. by R. T. Vanderbilt Co., Inc.

Corrosion inhibited aqueous composition—an aqueous solution in which the corrosive component is brine and mineral acid containing dissolved therein a glycol ether of an ethanol rosin amine. 2,510,063. Hercules Powder Co.

Adhesive composition—the heat reaction product of a mixture a copolymer of butadiene and acrylonitrile and a phosphoric acid selected from ortho-phosphoric acid and pyro-phosphoric acid. 2,510,090. Arberic T. Di Masi.

Bactericidal and bacteriostatic preparation comprising 1.0 part per million to 5% of 2,3-diphenyl indole dispersed in water. 2,510,428. B. S. Goodrich Co.

Composition for the control of coccidiosis comprising a poultry feed containing m,m'-dinitrodiphenyldisulfide. 2,510,486. American Cyanamid Co.

Medicated poultry and animal feed to control coccidiosis comprising bis-(3-nitrophenyl)-disulfoxide and the normal animal ration. 2,510,487. American Cyanamid Co.

Oleaginous oleophilic mixture of homopolymeric ethers of 1,2-epoxy linear hydrocarbons, suitable for use as a lubricating composition. 2,510,540. Shell Development Co.

Germicidal composition comprising an aqueous suspension of 1-(4-sulfamylphenyl)-3,5-dimethyl-4-nitrosopyrazole. 2,510,726. United States Rubber Co.

Manufacturing cold swelling starch preparations, the solutions of which when dried will produce water resistant layers, by adding a limited quantity of water and an aldehyde to a starch product, and heating above the gelatinizing point while pressing. 2,510,748. Naamlooze Vennootschap: W. A. Scholten's Chemische Fabrieken.

Wax composition for coating fruits comprising paraffin, a vegetable hard wax and a sulfonated mineral oil. 2,510,816. Emma L. Greenstreet.

Antioxidant composition—an organic acid of the class consisting of benzoic, fumaric, tartaric and citric, and an ester of the class consisting of low molecular weight alkyl esters of gallic acid and ascorbyl esters, in which the total of the respective proportions are such as to give a synergistic effect. 2,511,802. Griffith Labs., Inc.

Antioxidant composition—a solid hydrogenated fat in the form of flakes having dissolved therein an antioxidant acid of the class consisting of benzoic, fumaric, tartaric, phosphoric, ascorbic and citric acids and a gallic ester of the class consisting of methyl, ethyl, propyl, butyl, hexyl and lauryl gallates. 2,511,803. Griffith Labs., Inc.

Antioxidant composition—an antioxidant acid of the class consisting of benzoic, fumaric, tartaric, phosphoric, ascorbic and citric acids, a gallic ester of the class consisting of methyl, ethyl, propyl, butyl, hexyl, and lauryl gallates, and a non-toxic polyhydric alcohol. 2,511,804. Griffith Labs., Inc.

Adhesive tacky sealing compound containing polymerized linseed oil, asphalt, residual asphalt oil, clay, asbestos dust and exfoliated vermiculite. 2,511,830. Albert C. Fischer.

Producing, as flameproofing agents, monosulfates of glycols containing 2 to 6 carbon atoms by reacting glycol and sulfuric acid. 2,511,911. Walter M. Fuchs.

Azeotropic mixture of monochlorodifluoromethane and propane for use as a refrigerant. 2,511,993. Carrier Corp.

* From Vol. 634, Nos. 4, 5; Vol. 635, Nos. 1, 2, 3.

Preparing a sodium alumino silicate cation exchange material which, when converted to the corresponding silver alumino silicate, has a capacity for removal of chloride ions. 2,512,053. Permutit Co.

Transmitting power by means of a liquid, consisting essentially of an ester of an alcohol and naphthenic acids. 2,512,255. Gulf Research & Development Co.

Adhesives from blood hemoglobin, formaldehyde, and ethylene diamine. 2,512,418. Armour and Co.

Mineral oil concentrate capable of forming a stable oil-in-water emulsion—mineral oil and a mixture of water-soluble alkali metal salt of a secondary alkyl sulfate and alcohol having hydrophilic and oleophilic properties in admixture with a petroleum-ether soluble fraction of oil-soluble sodium petroleum sulfonate. 2,512,435. Shell Development Co.

Corrosion inhibitors in conversion of cyanamide or dicyandiamide to a derivative thereof by heating while dispersed in liquid ammonia in a closed pressure vessel in which all the internal surfaces in contact with the reaction mixture consist of a ferrous alloy selected from high-chrome or stainless steel, the improvement which consists of protecting the metallic surfaces exposed to the reaction mixture by adding ammonium phosphate. 2,512,590. American Cyanamid Co.

*Textiles**

In cleaning animal fibers the step consisting of subjecting said fibers to a mixture of a sulphuric acid solution and a ketone effective to inhibit ionization, containing not more than 20% water. 2,508,406. Manuel Levin.

In cleaning animal fibers, subjecting said fibers to a mixture of concentrated hydrochloric acid and a ketone effective to inhibit ionization, said mixture containing not over 8% water. 2,508,407. Manuel Levin.

Chemically modifying keratinous material to impart resistance to the action of reducing agents, oxidizing agents and alkalis while preserving the mechanical properties—immersing in a liquid bath containing a reducing agent for keratin (inert to formaldehyde), to rupture disulfide linkages; the bath also containing free formaldehyde, to form new stable alkylene cross-linkages between the keratin peptide chains. 2,508,713. Harris Research Labs.

Modifying a keratinous material to increase its resistance to attack by oxidizing agents, reducing agents and alkalis while preserving its mechanical properties—treating in a bath containing a reducing agent for keratin (inert to alkylene dihalides), to rupture disulfide linkages; the bath also containing an alkylene dihalide, to form new stable cross linkages between the keratin peptide chains. 2,508,714. Harris Research Labs.

Producing nylon and cellulosic yarn patterned fabric by treating selected areas with aluminum chloride, aluminum sulfate, zinc chloride or magnesium chloride; heating to disintegrate said treated lengths of pattern yarns and removing the disintegrated lengths to provide relatively open background areas in accordance with said predetermined pattern. 2,509,146. Sayles Finishing Plants, Inc.

Waterproofing textile fabrics by impregnating with an aqueous emulsion of a mixed ether comprising an aminotriazine condensation product etherified with saturated unsubstituted monohydric aliphatic alcohols, and thereafter heating. 2,509,174. Monsanto Chemical Co.

Composition for impregnating fibrous materials to impart water-repellent properties—heating amides of higher fatty acids or mixtures of higher fatty acids with nitriles and amides of fatty acids containnig the same number of carbon atoms as said fatty acids; thereafter chloromethylating and reacting the resulting chloromethylated product with a tertiary amine. 2,510,007. Sun Chemical Corp.

Insect proofing woolen fabrics with 2,3-diaryl indoles. 2,510,432. B. F. Goodrich Co.

Water-dispersible chemical to impart a water-repellent effect stable to dry cleaning—a quaternary ammonium compound formed by heating: a tertiary amine, an inorganic halogen compound selected from the group consisting of hydrogen chloride, hydrogen bromide, phosphorus trichloride, phosphorus oxychloride, phosphorus pentachloride, thionyl chloride and sulfuryl chloride, and a preformed condensation product of a fatty acid amide and a nitrogenous compound containing a plurality of alkoxymethyl radicals selected from N-alkoxy-methyl derivatives of urea and melamine. 2,510,522. ½ to Montclair Research Corp. and ½ to Ellis-Foster Co.

* From Vol. 634, Nos. 4, 5; Vol. 635, Nos. 1, 2, 3.

Transparentizing textiles—impregnating an open-meshed fabric with an unmixed water-insoluble urea formaldehyde ether resin. 2,510,919. Heberlein Patent Corp.

Forming a water-soluble reaction product of a natural rubber compound and sulfur dioxide, dispersing the insoluble product in aqueous potassium hydroxide and methyl alcohol; boiling to dissolve the dispersed product and acidifying with mineral acid to precipitate a water-soluble reaction product. 2,511,498. Shell Development Co.

Treating cellulose textiles to render shrink-proof, water-repellent, and crease-proof by applying dimethylol urea, an aldehyde, and octadecyloxymethyl pyridinium chloride to the textiles in an aqueous medium and in the presence of a catalyst. 2,512,195. Christian Bener.

Agricultural

Insect repellent mixture—a hydrogenated naphthol and a hydrogenated diphenyl. 2,512,675. Michel Pijoan and Leo A. Jachowski, Jr.

Stabilizing carotene-containing crops subject to oxidative deterioration by applying an aromatic amino inhibitor. 2,513,002. Universal Oil Products Co.

Nitrodithioacetates as fungicides. 2,513,018. Allied Chemical & Dye Corp.

Photochemical preparation of benzene hexachloride. 2,513,092. Solvay & Cie.

Rosin ammonium phenoxides as fungicides. 2,513,429. Hercules Powder Co.

Insecticides produced by reacting trialkyl phosphates with thiophosphoryl halides. 2,514,150. Eastman Kodak Co.

Herbicidal oil composition—a herbicidal hydrocarbon oil, a water-soluble emulsifying agent, and an imidazoline. 2,514,341. Standard Oil Development Co.

Chlorinated terpene sulfone and insecticidal composition containing same. 2,514,564. Hercules Powder Co.

Insecticidal compositions—either hexyl alkyl tetraphosphate or tetra-alkyl pyrophosphate and an alkali-metal fluoride or fluorosilicate. 2,514,621. Eastman Kodak Co.

Insecticide composition—a contact insecticide and a resin, derived from residues of clay tower treated gasoline. 2,514,714. Phillips Petroleum Co.

Den process for the manufacture of finely divided superphosphate fertilizer from phosphate rock acidulated with sulfuric and hydrofluosilicic acids. 2,515,163. Stauffer Chemical Co.

Herbicide concentrate—an alkanolamine salt of a chlorophenoxyacetic acid and a water-soluble methyl cellulose. 2,515,198. Dow Chemical Co.

Insecticidal composition—2-nitro-1,1-bis(p-chlorophenyl) alkanes. 2,516,186. Purdue Research Foundation.

Insect controlling composition—an alkyl 2-thiazolinyl sulfide. 2,516,313. E. I. du Pont de Nemours & Co.

Lecithin stabilizer for DDT petroleum solutions. 2,516,477. Phillips Petroleum Co.

Cellulose

Hydroxyethyl cellulose acetate chloroacetate. 2,512,960. E. I. du Pont de Nemours & Co.

Production of a regenerated cellulose structure by regenerating cellulose xanthate derived from viscose. 2,512,968. E. I. du Pont de Nemours & Co.

Cellulose mixed esters including aceto radicals and higher acyl radicals. 2,512,983. Gevaert Photo-Producten N. V.

Production of viscose solutions. 2,513,652. Industrial Rayon Corp.

Manufacture of hot and cold water soluble cellulose ethers by recovering cellulose ether with NaOH and NaCl, neutralizing with a suitable compound, adding water and a lower aliphatic alcohol, and expressing the bulk of the saline aqueous alcoholic solution. 2,513,725. Imperial Chemical Industries Ltd.

Bleaching a cellulosic material by subjecting to the action of an aqueous solution of hypochlorite and chlorite. 2,513,787. Brown Co.

Recoverig the free acid form of carboxyalkylcellulose by acid treatment of a dried crude etherification reaction mixture. 2,513,807. Hercules Powder Co.

Producing viscose having an opacifying agent dispersed in the viscose without objectionable scum formation. 2,516,113. Rayonier Inc.

Precipitating viscose without substantially regenerating coagulated cellulose xanthate, by treatment with aqueous salt solution. 2,516,316. E. I. du Pont de Nemours & Co.

Ceramics

Optical glass consisting of SiO_2, B_2O_3, BaO, and ThO_2. 2,512,993. Chance Brothers Ltd.

Electric insulating bushing and glass comprising SiO_2, B_2O_3 Li_2O, Na_2O, K_2O, Al_2O_3, CaO and PbO. 2,513,958. General Electric Co.

Forming cellular glass from pulverulent glass, finely divided carbon and an alkaline earth metal sulfate. 2,514,324. Pittsburgh Corning Corp.

Color-correcting titania-bearing porcelain enamels. 2,514,855. Ferro Enamel Corp.

Rendering TiO_2 batches color-uniform. 2,514,856. Ferro Enamel Corp.

Shrinking stretched cellulose acetate fibers with diethyl ketone. 2,515,402. Celanese Corp. of America.

Manufacture of ceramic dielectric elements from barium titanate and a fluoride with complete embedding in powdered zirconia and firing. 2,515,790. General Elecrtic Co.

Transparentizing regenerated cellulose silk with an aqueous acid solution and treating such material with an aqueous caustic alkali, solution. 2,516,083. Heberlein Patent Corp.

Forsterite refractory made from natural magnesium silicates. 2,516,249. Harbison-Walker Refractories Co.

Insulating finishing cement dry mix containing mineral fibers, cementitious ingredients, and binder. 2,516,342. Merwyn C. Randall and George S. Gethen.

Coatings

Making an alkaline type, stable, aqueous coating composition of at least 30% dry solids containing animal glue as the adhesive bonding agent. 2,513,121. Peter Cooper Corporations.

Modifying the properties of a hydrocarbon drying oil recovered from a conjunct polymerization sludge by contacting with a boron trifluoride complex catalyst. 2,513,558. Universal Oil Products Co.

Multiple step phosphate coating process for ferrous metals using baths of an acid phosphate solution containing zinc and ferrous iron. 2,514,149. Parker Rust Proof Company.

Antifouling coating composition of antifouling pigment, rosin, Hercolyn (hydrogenated methyl abietate), chlorinated rubber, diatomaceous silica and naphtha. 2,514,868. H. H. Robertson Co.

Protective liquid composition for metal surfaces containing an aqueous solution of a metal phosphate and phosphoric acid and a small amount of anhydrous zinc ammonium phosphate. 2,514,941. Walterisation Co. Ltd.

Coating composition to detect the presence of water containing an organic dyestuff which develops strong coloration in contact with moisture. 2,515,232. Morris S. Kantrowitz and Earl J. Gosnell.

Coating composition—a pentaerythritol ester of a dehydroabietyl N-substituted carbamic acid and a drying oil. 2,515,290. Hercules Powder Co.

Phosphatizing liquid for phosphate coating articles made of metal capable of reacting with phosphoric acid to form a metal phosphate. 2,515,934. Du-Lite Chemical Corp.

Phosphate coatings on metals by applying a hot aqueous solution of a disodium orthophosphate activating composition, a water soluble organic acid to stabilize the activating composition, and a metal cleaning agent. 2,516,008. Westinghouse Electric Corp.

Treating ferriferous metal surfaces with a manganese phosphate coating bath containing the ions of a tartaric acid other than mesotartaric acid. 2,516,139. American Chemical Paint Co.

Coating composition comprising an alcohol-soluble, heat-convertible, phenolic resin. 2,516,351. Monsanto Chemical Co.

Obtaining bodied oils by heating a drying or semi-drying oil in contact with a resin which contains combined sulfur dioxide. 2,516,590. E. I du Pont de Nemours & Co.

Protecting ferriferous and aluminiferous surfaces by cleaning, treatment wetting agent and applying an organic surface-protective coating. 2,516,685. American Chemical Paint Co.

Protein coating composition immune to bacterial decomposition. 2,516,700. Swift & Co.

Detergents

Stabilizing a sulphated product formed by reacting sulphamic acid with an organic compound by admixing sulphated product with a buffer agent. 2,513,549. Colgate-Palmolive-Peet Co.

Washing glass articles by first washing in an aqueous solution containing free uncombined caustic soda and a glass attack inhibitor, and then in an inhibitor-free solution containing caustic alkali. 2,514,304. Wyandotte Chemicals Corp.

Making an amido-amino-amine soap in which the amide

group is derived from fatty acids and the soap group from rosin acids. 2,514,954. Nostrip Inc.

Noncaking detergent composition—an alkyl aryl sulfonate, an inorganic salt builder, and a sodium silicate. 2,515,577. Wyandotte Chemicals Corp.

Granulating dry powdered detergent mixtures by making a paste to form the continuous phase and converting the free-flowing mass to a unitary mass, and screening. 2,515,880. Mathieson Chemical Corp.

Dyes & Pigments

Monoazo-dyestuffs. 2,512,845. Ciba Ltd.

Dyeing structures prepared from acrylonitrile polymers by treating with an aqueous dye bath containing meta-cresol and a dispersed acetate dye. 2,512,969. E. I. du Pont de Nemours & Co.

Tetrazaporphine pigments containing styrene groups, polymers thereof, and method for their production. 2,513,098. American Cyanamid Co.

Production of dyestuffs and pigments by reacting a monocarboxylic acid anhydride with an S-thioglycollic acid derivative. 2,513,923. Ilford Ltd.

Manufacture of brown pigments by coupling a tetrazotized amine with a 1-aryl-3-methyl-5-pyrazolone. 2,514,236. Imrivative. 2,513,923. Ilford Ltd.

Printing of cellulose acetate using methyl cellulose as a thickener for strongly alcoholic dye solutions. 2,514,410. Celanese Corp. of America.

Printing cellulose acetate fabrics with oxidation dye pastes comprising an alcohol and thickened with methyl cellulose. 2,514,411. Celanese Corp. of America.

Methine dyes containing a pyrimidazolone group. 2,514,649. Eastman Kodak Co.

Dyeing composition—a dispersion of a water-insoluble pigment in an aqueous solution of a water-soluble thermosetting resin, a water-soluble heat-precipitable alkyl cellulose, and a hydrophilic substance. 2,515,170. Interchemical Corp.

Copperable disazo dyestuffs. 2,515,546. J. R. Geigy A. G.

Aliphatic-cyano-azo compounds. 2,515,628. E. I. du Pont de Nemours & Co.

Method of incorporating selenium in cadmium red pigments. 2,515,721. American Cyanamid Co.

Dibenzanthrone dyestuff. 2,515,723. General Aniline & Film Corp.

Ring systems from azo dyes—a polynuclear heterocyclic compound of the class consisting of naphtho-[2,1-e]-s-triazolo-[5,1-c]-as-triazines, and naphtho-[2,1-e]-tetrazolo-[5,1-c]-as-triazines. 2,515,728. General Aniline & Film Corp.

Acid aftertreatment of metallized resorcinol-azo dyes further coupled on the fiber. 2,515,743. General Aniline & Film Corp.

Pyrrole dimethinecyanine dyes. 2,515,905. Eastman Kodak Co.

Pyrrole dimethinecyanine dyes. 2,515,912. Eastman Kodak.

Dyeing a fabric by immersing in an alkaline solution of 3,4-thiolanedithione, removing and subjecting to an oxidizing atmosphere. 2,515,922. Socony-Vacuum Oil Co., Inc.

Aftertreatment with an aldehyde of wool dyed with chromed azo dyes. 2,516,496. Ciba Ltd.

Producing anatase titanium dioxide pigments by roasting a titanium sulfate hydrolysate to convert the hydrolysate to small anatase crystals but insufficient to develop pigment properties, then calcining in the presence of a quantity of phosphate. 2,516,548. American Cyanamid Co.

Inorganic

Preparing Cr_2O_3-hydrogenating metal oxide catalysts by forming homogeneous mixture of chromium trioxide and a metal acetate and decomposing by heating. 2,512,653. Givaudan Corp.

Decolorizing and purifying colored and impure titanium tetrahalide by mixing with a titanyl halide, heating, distilling off the purified tetrahalide. 2,512,807. Douglas Gillison Nicholson.

In the electrochemical conversion of aqueous sodium chlorate solution to sodium perchlorate solution, making an aqueous electrolyte consisting of a saturated solution of sodium chlorate, sodium chromate and magnesium chloride; and electrolyzing between steel and platinum electrodes. 2,512,973. Western Electrochemical Co.

Producing hydrogen by the conversion of hydrocarbons and steam in the presence of a catalyst favorable to carbonization in one stage and the formation of carbon dioxide and hydrogen in another stage. 2,513,022. Phillips Petroleum Co.

Inhibiting the corrosivity of a solution consisting of aqueous sulfuric acid in contact with a ferrous metal surface by the use of boron trifluoride. 2,513,131. Standard Oil Development Co.

Producing oxygen by the liquefaction and rectification of air. 2,513,306. Hydrocarbon Research, Inc.

Catalytic absorbent composed of carbon impregnated with sodium cyanate and copper oxide, particularly adapted for removing both arsine and cyanide chloride from gas. 2,513,508. U.S.A. as represented by the Secretary of War.

Producing sulphur which is insoluble in carbon bisulphide by introducing a stream of sulphur vapor into a cold aqueous quenching bath to condense the sulphur vapor and adding an oxidizing salt during the quenching. 2,513,524. Stauffer Chemical Co.

Producing a nickel-kieselguhr catalyser for refining drying, semi-drying oils and train-oils. 2,513,529. Sana, Narodni Podnik.

Solid finely divided particles of water-reactive hydride of a metal having a coating consisting of a water insoluble organic acid and water repellent compound. 2,513,997. Metal Hydrides Inc.

Dissolving a difficultly soluble metal sulfate by contacting said metal sulfate with an aqueous solution containing dissolved nitrate of tetravalent zirconium. 2,514,115. U.S.A. as represented by the U.S. Atomic Energy Commission.

Production of gases rich in hydrogen. 2,514,340. Standard Oil Development Co.

Manufacture of sulfamates by reacting a liquid, anhydrous tertiary amine, devoid of hydroxyl, amino or imino group substituents, with sulfur trioxide, reacting the resultant mixture with anhydrous ammonia and separating the sulfamate salt from tertiary amine. 2,514,955. Mathieson Chemical Corp.

Producing a readily soluble, granular free flowing, substantially non-caking composition of monocalcium phosphate and free H_3PO_4. 2,514,973. Monsanto Chemical Co.

Preparing a solution of aluminum chloride catalyst of uniform activity. 2,515,138. Standard Oil Development Co.

Making titanium carbide by reacting titanium and carbon in molten iron, at about 2800° C. 2,515,463. Kennametal Inc.

Preparing a stable aquasol containing silica. 2,515,949; 2,515,960; 2,515,961. Monsanto Chemical Co.

Producing a stable sulfur suspension by heating an aqueous suspension of finely divided solid sulfur for about one hour to decrease the damage occasioned by agglomeration upon freezing. 2,516,095. Stauffer Chemical Co.

Improved process for the manufacture of crystalline ammonium sulfate. 2,516,420. Phillips Petroleum Co.

Preparing a titanium sulfate hydrolysis nucleating agent by boiling an aqueous slurry of purified titanium sulfate hydrolysate with an alkali metal hydroxide, filtering, washing the excess alkali from the residue and neutralizing with hydrochloric acid. 2,516,604. American Cyanamid Co.

Treating lithium-sodium phosphate to prepare a halide of lithium by reacting a hot aqueous slurry of the finely divided phosphate with a hot aqueous solution of the corresponding halide of aluminum or iron. 2,516,659. Dow Chemical Co.

Oxygen production. 2,516,717. Standard Oil Development Co.

Leather

Resorcinol-aldehyde tanning product. 2,512,708. E. I. du Pont de Nemours & Co.

In production of leather from hide, tanning a hide with an aqueous solution of a low molecular aliphatic dialdehyde and treating with an aqueous solution of a reactive resin-forming composition. 2,516,283. Adolph H. Winheim and Edward E. Doherty.

Impregnating a dialdehyde tanned hide with a resin of urea, formaldehyde, and a primary amine. 2,516,284. Adolph H. Winheim and Edward E. Doherty.

De-salting pickled stock, such as hides and skins and avoiding inordinate acid-swelling and gelatinization by drumming in an aqueous solution containing a salt of a phosphoric acid capable of coagulating albumen, and crystalline ammonium phosphate. 2,516,806. Hall Labs., Inc.

Metals

Concentration of sulfide ores containing metals such as lead, silver, zinc, iron and gold, by flotation and treatment with chemical collecting agents and activators. 2,512,669. Koppers Co.

Treating an aqueous, stannous plating bath with a quantity of an alkali ferricyanide or ferrocyanide in slight excess of that required to precipitate copper and iron. 2,512,719. E. I. du Pont de Nemours & Co.

Electrodeposition of nickel from an acid bath. 2,513,280. Udylite Corp.

Purifying aluminum by distillation of mixtures with other metals. 2,513,339. Independent Aluminum Corp.

Electroplating tin on ferrous strip by traveling unplated ferrous strip through an alkaline tin plating bath in which the strip is made the anode and then immediately thereafter electroplating the treated unplated ferrous strip with tin in an alkaline tin plating bath where the strip is made the cathode. 2,513,859. Crown Cork & Seal Co., Inc.

Electrolysis of light metals. 2,514,283. U.S.A. as represented by the Secretary of the Navy.

Welding electrode including a core formed of copper-zinc alloy and a coating consisting of: cryolite, fluorspar, lithium chloride, manganese, and sodium silicate. 2,514,386. Charles T. Gayley.

Electrolytically polishing metals of the group consisting of ferrous metals, nickel, brass and aluminum using as electrolyte a mixture of a concentrated aqueous solution of an alkali metal salt and a completely water miscible alcohol. 2,516,105. Edward der Mateosian.

Extracting lithium from spodumene ores, by heating to convert the lapha-spodumene to beta-spodumene, mixing with strong sulphuric acide, roasting, and leaching with an aqueous liquid to extract lithium sulfate. 2,516,109. Metalloy Corp.

Electroplating of chromium-molybdenum alloys by dissolving chromic oxide and molybdenum trioxide in water, adding sulphuric acid, heating and passing electric current through, using a base metal cathode and an anode of molybdenum. 2,516,227. Westinghouse Electric Corp.

Making iron powder by electrolyzing an aqueous acid solution of ferrous perchlorate in water and electrodepositing a friable spongy mass of iron at the cathode. 2,516,515. American Metal Co., Ltd.

Organic

Production of an alkenyl thiophene by reacting a 2-alkyl thiophene with formaldehyde in the presence of an acid catalyst. 2,512,596. Phillips Petroleum Co.

Production of highly branched chain hydrocarbons by copolymerization of a secondary and a tertiary alcohol, hydrohalogenation of the olefinic products, and methylating the hydrohalogenated olefins. 2,512,649. U.S.A. as represented by the Secretary of Commerce.

Production of a pyridine derivative containing a $CH_2=C<$ group by reacting an alkylpyridine formaldehyde in the presence of catalytic amounts of an acid material forming the corresponding hydroxyalkyl pyridine by dehydration to the corresponding pyridine derivative. 2,512,660. Phillips Petroleum Co.

Fluorescent, crystalline compound selected from the group consisting of cuprous nicotine thiocyanate, cuprous nicotine cyanide, and cuprous nicotinamino thiocyanate. 2,512,689. U.S.A. as represented by the Secretary of Agriculture.

Carbamic acid esters of (3-hydroxy-2-pyridylmethyl)amines and salts thereof. 2,512,732. Hoffman-La Roche Inc.

A new composition of matter containing an acetal, $ROCH(CH_3)OR$, having dissolved therein a polymer from esters of the formula $CH_2=C(R_1)COOR_2$ wherein R_1 is hydrogen or the methyl group and R_2 is the hydrocarbon residue of a saturated monohydric aliphatic alcohol. 2,512,771. Rohm & Haas Co.

Pyridylethylpyridinium compounds. 2,512,789. Francis E. Cislak and Leslie H. Sutherland.

N'-butyrylsulfanilamides. 2,512,898. American Cyanamid Co.

Production of polyoxymethylene ethers by forming a nonaqueous solution of formaldehyde or formaldehyde polymers of the polyoxymethylene type dissolved in a saturated aliphatic alcohol, and adding concentrated sulfuric acid to the solution, as a catalyst. 2,512,950. E. I. du Pont de Nemours & Co.

Aminoalkyl sulfonyl piperazines. 2,513,026. Societe des Usines Chemiques Rhone-Poulenc.

Preparing a 1,1-diacyloxy-2-alkene by passing a gaseous stream of the vapors of an acyclic alpha, beta-olefinic aldehyde and of a volatile, aliphatic, carboxylic acid anhydride into contact with a phosphoric acid catalyst. 2,513,090. Shell Development Co.

Oxidation of heterocyclic aromatic nitrogen compounds by reacting nitric acid with a solution containing the N-heteroaryl compound and a relatively small amount of a mercury or copper compound dissolved in sulfuric acid. 2,513,099. Allied Chemical & Dye Corp.

Preparing aryl silicon compounds by heating a monocyclic aromatic hydrocarbon with a fully chlorinated disilane, in the presence of sulphur monochloride. 2,513,123. Linde Air Products Co.

Preparing 3-aminopropanol by treating a liquid mixture of products prepared by heating acrolein in slightly acid aqueos solution with ammonia and hydrogen in the presence of a Raney nickel hydrogenation catalyst. 2,513,132. Shell Development Co.

4-Hydroxy-3-hydroxymethyltetrahydropyran. 2,513,133. Shell Development Co.

3-Thienylacetic acid. 2,513,140. Indiana University Foundation.

Water-soluble acid addition salts of 4,4-diphenyl-6-morpholino-heptan-3-one. 2,513,173. Glaxo Labs Ltd.

Alcohol derived from 1-vinylcyclohexene-3. 2,513,179. Sun Oil Co.

Oxidation of an N-heteroaryl compound containing a pyridine nucleus and having an oxidizable organic grouping by reacting said compound in a sulfuric acid medium with gaseous nitrogen tetroxide. 2,513,251. Allied Chemical & Dye Corp.

Producing diolefins of a purity in excess of 98% by distilling a contaminated diolefin stream in the presence of a high boiling petroleum gas oil. 2,513,252. Standard Oil Development Co.

Triazine derivatives. 2,513,264. American Cyanamid Co.

Production of 2-iminopiperidines and 2-iminopyrrolidines. 2,513,270. The Regents of the University of Michigan.

Acenaphthoyl alkanoic acids. 2,513,273. G. D. Searle & Co.

Recovering aconitic acid from plant extracts by precipitating metal ions, at least a portion of which is barium or strontium. 2,513,287. Donald Walter Collier.

Obtaining organic amino diols by reacting a thionyl halide with a (dl)-reg. amino diol derivative. 2,513,346. Parke, Davis & Co.

1-(Aminoalkyl)-1, 2, 3, 4-tetrahydrofluoranthenes. 2,513,487. Ciba Pharmaceutical Products, Inc.

Production of chlorobutyl esters of carboxylic acids by reacting a mixture of a carboxylic acid, phosphorus trichloride and tetrahydrofuran in the presence of zinc chloride. 2,513,504. Celanese Corp. of America.

Purifying crude cyclopentanone by heating with a small proportion of concentrated phosphoric acid, chromic acid or hydrochloric acid. 2,513,534. U. S. A. as represented by Secretary of the Navy.

Preparing 2-alkyl-4, 6-dihydroxypyrimidines by bringing together an alkali metal amide and an alkyl nitrile in liquid ammonia, removing the excess ammonia, adding a diester of malonic acid, an alkali metal alkoxide, and anhydrous alcohol, whereupon there is formed an alkali metal salt of a 2-alkyl-4, 6-dihydroxy-pyrimidine. 2,513,550. American Cyanamid Co.

Methyl-substituted 2-thenoyl-o-benzoic acids. 2,513,570. E. I. du Pont de Nemours & Co.

Methyl-thiophanthraquinones. 2,513,571. E. I. du Pont de Nemours & Co.

Halogenated (2-thenoyl)-o-benzoic acids. 2,513,572. E. I. du Pont de Nemours & Co.

Nitro-(2-thenoyl)-o-benzoic acids. 2,513,573. E. I. du Pont de Nemours & Co.

Halogen thiophanthraquinones. 2,513,574. E. I. du Pont de Nemours & Co.

Preparation of pelargonyl beta-lactone by reaction of heptaldehyde with a ketene in the presence of benzoyl peroxide. 2,513,615. Shell Development Co.

Compositions containing amylaceous materials and a dihydroxyphospholipid. 2,513,638. Food Technology, Inc.

Alkoxymethoxyalkyl vinyl ethers. 2,513,642. E. I. du Pont de Nemours & Co.

Recovering an alkyllead from the reaction products accompanying its synthesis by steam distilling the reaction mass in the presence of an aqueous solution of an iron salt and sodium thiosulfate. 2,513,659; 2,513,654. Ethyl Corp.

2(3)Benzofuranone derivatives. 2,513,698. Abbott Labs.

Cyclic amino-acetals. 2,513,747. Ciba Ltd.

In production of glutaric acid, the improvement consists of mixing an aqueous solution of alpha-hydroxyaldipaldehyde and aqueous hydrogen peroxide. 2,513,766. Shell Development Co.

Mono-halogen-substituted-thiophanthraquinone. 2,513,790. E. I. du Pont de Nemours & Co.

Organo-metallic complexes of Mn. 2,513,793. Laboratoire Sapos S. A.

Preparing ketenes by heating a long chain monocarboxylic fatty acid with acetic anahydride and, simultaneously adding a cetic anhydride. 2,513,825. E. I. du Pont de Nemours & Co.

β-Aromatic sulfonhydrazide. 2,513,826. General Aniline & Film Corp.

Production of β-acylamido-β-carbalkoxy piperidones. 2,513,831. General Mills, Inc.

Making 2-hydroxy ethyl mercapto thiazoles by heating ethylene oxide with a mercapto thiazole in an inert organic solvent. 2,513,922. Monsanto Chemical Co.

Dimethylchloromethylchlorosilane. 2,513,924. General Electric Co.

Stabilizing an edible fatty oil by adding citric acid and heating to break down a substantial part of the citric acid into aconitic acid and aconitic anhydride. 2,513,948. Southern Cotton Oil Co.

Producing an imine by reacting a primary amine with an imine. 2,513,996. Shell Development Co.

Production of p-nitrobenzene sulfonamido pyrimidines by reacting, in a lower alkyl monocarboxylic acid solution, a tetra-lower alkyl acetal of a 1, 3-oxocarbonylic compound with p-nitro benzene sulfonylguanidine. 2,513,999. General Aniline & Film Corp.

3-Monocarboxylic acids-2-thiono-thiazines. 2,514,004. B. F. Goodrich Co.

Recovering aconitic acid from alkaline earth aconitates by reacting with a small excess of hydrochloric acid in the presence of an aqueous solution of alkaline earth chlorides to produce aconitic acid dissolved in a solution of alkaline earth chlorides, separating from undissolved material, cooling to produce crystals of aconitic acid and purifying. 2,514,010. Morton Salt Co.

Preparing 2, 5-diacyloxy-2, 5-dihydrofurans in which a furan having no strong electronegative groups in the α position is treated with halogen, an organic acid and an acid-binding agent. 2,514,026. Kemisk Vaerk Koge A/S.

Manufacture of acetic anhydride—forming a reactant liquid and molecular oxygen mixture, containing acetaldehyde, acetic acid, acetic anhydride and catalyst, passing said mixture through a tubular reaction zone, discharging into a separator, withdrawing an amount of the reaction mixture from the system for the recovery therefrom of acetic anhydride, and recirculating the remainder. 2,514,041. Distillers Co., Ltd.

Substituted pyrans. 2,514,156. Shell Development Co.

Derivatives of dihydropyran. 2,514,168. Shell Development Co.

Unsaturated ester of a carboxylic acid selected from 3, 4-dihydro-1, 2-pyran-2-carboxylic acid and tetrahydro-pyran-2-carboxylic acid. 2,514,172. Shell Development Co.

Stannous phenylcatecholates. 2,514,179. Firestone Tire & Rubber Co.

Producing stannous catecholates by reacting a stannous salt with normal alkali metal catecholate in a medium in which they are both soluble. 2,514,180. Firestone Tire & Rubber Co.

Trivalent antimony salts of halogen-substituted phenol sulfides. 2,514,186. Firestone Tire & Rubber Co.

Stannous diphenol sulfoxide. 2,514,188. Firestone Tire & Rubber Co.

Stannous catecholate. 2,514,199. Firestone Tire & Rubber Co.

1, 3, 6-Thiadiazepine-2-thiones. 2,514,219. Firestone Tire & Rubber Co.

Aminoplasts containing silicon comprising a condensation product of an aldehyde and a silicon oxyamide. 2,514,268. Monsanto Chemical Co.

Preparing pure carbon monoxide by charging pure carbon dioxide to a fluidized mass of a reduced VI group heavy metal oxide, with subsequent recycling and absorption of fractions. 2,514,282. Standard Oil Development Co.

Production of secondary butyl alcohol from a hydrocarbon mixture containing butanes and butenes free of isobutylene by subjecting the hydrocarbon mixture to extractive distillation in aqueous acetone, removing an aqueous acetone solution of hydrocarbons containing normal butenes, separating the hydrocarbons and contacting with sulfuric acid, extracting a raffinate phase consisting of hydrocarbons containing 40-50 vol. percent normal butenes, distilling the raffinate phase and hydrolyzing the extract to recover secondary butyl alcohol. 2,514,291. Standard Oil Development Co.

Preparation of aliphatic mercaptans by heating mixed aliphatic straight chain, primary, monohydric alcohols, sulfur, and hydrogen in the presence of a TiO_2 gel hydrogenating catalyst. 2,514,299; 2,514,300. Standard Oil Development Co.

Iron carbonyl blended, by means of an organic solvent, with a tall oil soap composition, obtained by saponifying tall oil in a liquid diluent aliphatic alcohol, with an alkylene polyamine, and completing the saponification with potassium hydroxide. 2,514,312. General Aniline & Film Corp.

4-Methyl-6-(3, 4-dioxymethylene phenyl) alpha pyrone. 2,514,325. William R. Warner & Co., Inc.

Preparing dialkyl alicyclic derivatives of the class consisting of 3, 5-dimethylcyclohexanone and 3, 5-dimethylcyclohexanol from isophorone by subjecting the isophorone to a controlled hydrogenolysis reaction in the presence of a hydrogenation catalyst. 2,514,329. Standard Oil Development Co.

Selectively depolymerizing isobutylene polymers which are dimers and trimers to form substantially pure isobutylene monomer. 2,514,332. Standard Oil Development Co.

Isomerization of 2-hydroxy-phenyl-phenyl-methyl-methane to 4-hydroxy-phenyl-phenyl-methyl-methane by heating the former in contact with phenol and a catalyst consisting of aluminum chloride, hydrogen fluoride, or boron trifluoride. 2,514,347. Monsanto Chemical Co.

Preparing a hexahydronaphthalene by passing 1, 4-diacetoxy-decahydro-naphthalene through a tube heated to 400-500° C. 2,514,365. Eastman Kodak Co.

Triacyl nitrophenylpropaneaminodiols. 2,514,376. Parke, Davis & Co.

1-Nitrophenyl, 2-amino, 1, 3-propanediols. 2,514,377. Parke, Davis & Co.

Compound of the group consisting of 1-(3,4-dihydroxyphenyl)-N^2-methyl-ethylenediamine, 1-(3-hydroxyphenyl)-N^2-methyl-ethylenediamine, and the salts thereof. 2,514,380. Hoffman-La Roche, Inc.

Heating 1, 1, 3, 3-tetracyano propane, condensing the effluent vapors, and separating 1, 1-dicyano ethylene from the resulting condensate. 2,514,387. B. F. Goodrich Co.

Catalytic alkylation of a phenol with a mono-olefin admixing the phenol with the mono-olefin and a C_3-C_5 paraffinic hydrocarbon diluent, contacting with a catalyst, fractionating, separating the diluent by introducing an intermediate boiling hydrocarbon having 6-8 carbon atoms. 2,514,419. Phillips Petroleum Co.

Manufacture of diphenylamine by deammoniation of aniline, using an aniline hydrochloride-aluminum chloride catalyst to form diphenylamine. 2,514,430. Koppers Co., Inc.

Amides of fluorinated propionic acids of the formula $CF_2ClCClXCONH_2$ where X is selected from the group consisting of fluorine and chlorine. 2,514,473. American Viscose Corp.

Producing a cycloalkylperhydroindan hydrocarbon by effecting a hydrogen transfer in the presence of an acid-acting catalyst between a branched chain olefin and a para-disubstituted aromatic hydrocarbon having as one substituent a hydrocarbon group containing only one hydrogen atom joined to the carbon atom combined with the aromatic ring to form an arylindan hydrocarbon, hydrogenating to a cycloalkylperhydroindan hydrocarbon. 2,514,546. Universal Oil Products Co.

Production of esters of formyl-amino acids, in which the formyl-amino groups are separated from the esterified carboxyl groups by more than one carbon atom, by hydrogenating esters of cyano-acids in the presence of an ester of formic acid, using a Raney nickel or Raney cobalt catalyst. 2,514,549. Celanese Corp. of America.

Separating natural triglycerides into solid and liquid fractions by dissolving the triglycerides in propyl acetate, ethyl acetate or methyl isobutyl ketone, chilling rapidly to affect precipitation of the more solid triglycerides, removing the solid triglycerides from the liquid triglycerides, and then recovering the glycerides from the solvent. 2,514,608. Emery Industries, Inc.

Acid chlorides of thio and dithiodiglycolic acids. 2,514,640. Shell Development Co.

Preparation of monomeric 2, 2, 4-trimethyl-1, 2-dihydroquinoline by heating a polymer 2, 2, 4-trimethyl-1, 2-dihydro-quinoline under reduced pressure in the presence of a boron trifluoride catalyst. 2,514,648. B. F. Goodrich Co.

Alpha-substituted acrylic acid esters by reacting an ester represented by the formula: $CH_2{=}CH\text{-}COOR$ wherein R is an alkyl group of the formula C_nH_{2n+1}, a benzyl group, or a β-phenylethyl group, with tertiary butyl hypochlorite and an aliphatic acid represented by the formula, R_1COOH, to give a mixture of an ester of an α-acyloxy-β-chloropropionic acid and an ester of a β-acyloxy-α-chloropropionic acid, and thereafter reacting with an organic tertiary amine to give α-substituted acrylic acid esters. 2,514,672. Eastman Kodak Co.

Stabilization of 3, 4-dihydro-1, 2-pyran-2-carboxaldehyde by use of tannic acid. 2,514,688. Shell Development Co.

Diallyloxyalkyl maleates. 2,514,786. Rohm & Haas Co.

Production of alkyl-substituted phenols having no more than three carbon atoms in a single alkyl substituent from polyalkyl substituted phenols by contacting in the vapor phase, with a synthetic catalyst formed by precipitation of the axides of alumina and silica. 2,514,960. Shell Development Co.

Recovery of aldehydes having from 6 to 10 carbon atoms

from crude aldehydic reaction products obtained by the interaction of carbon monoxide, hydrogen and an unsaturated organic compound having an olefinic unsaturation in the presence of a cobalt catalyst. 2,514,961. Shell Development Co.

Separating an alpha-beta unsaturated aliphatic aldehyde from a crude alpha-beta unsaturated aliphatic aldehyde obtained by the oxidation of the corresponding olefin extractively distilling said aldehyde at subatmospheric pressure in the presence of water. 2,514,966. Shell Development Co.

Separating acrolein from a mixture of acrolein, propionaldehyde and acetone, by extractive distillation. 2,514,967. Shell Development Co.

Separating acrolein from a mixture of acrolein and propionaldehyde by contacting water flowing countercurrent to a stream of inert gas to form a gaseous phase consisting of said stripping gas and acrolein and a liquid phase consisting of water containing propionaldehyde. 2,514,968. Shell Development Co.

Preparing 1, 4-dihydroxy-decahydronaphthalene, by catalytically hydrogenating 1, 4-dihydroxy-5, 8-dihydro naphthalene in the presence of finely divided nickel. 2,514,987. Eastman Kodak Co.

Selectively removing tertiary olefins from mixtures of hydrocarbons by absorbing the tertiary olefins with an aqueous solution of a mixture of an organic sulfonic acid and a water-soluble polybasic mineral acid. 2,515,006. Standard Oil Development Co.

Desterolating an oil concentrate by precipitating sterols with methyl alcohol or ethylene glycol. 2,515,041. Eastman Kodak Co.

Fractionating starch into its A- and B-fractions dissolving starch in a mixture of water and aliphatic alcohol, cooling to precipitate the A-fraction, separating, cooling to precipitate the B-fraction and separating the B-fraction. 2,515,095; 2,515,096. Corn Products Refining Co.

Preparing the monoacetate of 1, 3-propanediol by subjecting beta-acetoxy-propionaldehyde to the action of hydrogen in the presence of a nickel hydrogenation catalyst prepared by treating Raney nickel catalyst with an acid-reactive electrolyte, non-poisonous thereto. 2,515,108. Shell Development Co.

Preparing isobutyl hexyl sulfone and isobutyl 2-hydroxyhexyl sulfide by passing an oxygen containing gas into a liquid solution of 2-methylpropanethiol and 1-hexene and containing di-tertiary-butyl diperoxalate. 2,515,120. Shell Development Co.

Acylating furan, by reacting with an acyl halide or carboxylic acid anahydride in the presence of a boron trifluoride-organic complex. 2,515,123. Socony-Vacuum Oil Co., Inc.

Separation of butadiene from hydrocarbon gases with cuprous chloride. 2,515,134. Standard Oil Development Co.

Fluoroalkylthiophenes. 2,515,139. Socony-Vacuum Oil Co., Inc.

Heating a mixture consisting of dicyandiamide and formalin until a solidified product is obtained, and drying. 2,515,143. American Cyanamid Co.

Incorporation of Prussian blue into stand-oil, by treating an aqueous suspension of the said Prussian blue with isobutyl alcohol, distilling to remove the water and isobutyl alcohol, replacing with stand-oil during the course of the distillation until all water and isobutyl alcohol has been removed and then recovering the desired Prussian blue stand-oil mixture. 2,515,145. Shell Development Co.

Producing pyrazoles by reacting in an acid medium a diacetal of a 1, 3-oxocarbonylic compound with a hydrazine. 2,515,160. General Aniline & Film Corp.

4-Hydroxy-3-methyloltetrahydropyran. 23,248. E. I. du Pont de Nemours & Co.

Manufacture of a new N-monosubstituted diimidazole by condensing a solution of an alkali salt of a diimidazole. 2,515,173. Ciba Ltd.

Sulfurizing with elemental sulfur a condensate prepared by reacting alpha pinene with phosphorus sulfide. 2,515,222. Sinclair Refining Co.

In alkylation of naphthalene with ethylene for the manufacture of a mixture containing a high ratio of beta-ethylnaphthalene to alpha-ethylnaphthalene the steps of heating in contact with a silica-alumina catalyst. 2,515,237. Koppers Co., Inc.

α-Acylamido-β-hydroxy nitro substituted propiophenones. 2,515,239. Parke, Davis & Co.

Nitrophenyl ketonic amino alcohols. 2,515,240. Parke, Davis & Co.

Nitrophenyl acylamino acyloxy ketones. 2,515,241. Parke, Davis & Co.

Making thiophenethiol, by preheating sulfur and a C_4 hydrocarbon selected from the group consisting of normal butane, normal butenes, and butadienes. 2,515,242. Socony-Vacuum Oil Co., Inc.

Preparing a guanidine sulfate by carbon dioxide, ammonia, and sulfur trioxide. 2,515,244. American Cyanamid Co.

Polyfluoro aliphatic diamines. 2,515,246. Purdue Research Foundation.

Hydrolysis of 2, 5-dihydrofurans to produce unsaturated dicarbonyl compounds. 2,515,304. Imperial Chemical Industries Ltd.

Reacting an ester of a 2, ξ, ξ, ξ-tetrahalogenoalkanoic acid with hydrogen in the presence of a hydrogenation catalyst and thereby effecting selective replacement of the 2-halogen atom with hydrogen. 2,515,306. United States Rubber Co.

Production of N-acetylanthranilic acid by reaction of N-acetylanthranilic-acetic anhydride with anhydrous acetic acid. 2,515,320. Heyden Chemical Co.

Treating a sugar-containing solution by adding a 70-30 to about a 30-70 mixture of a magnesium compound-containing material and the combined waste products resulting from the manufacture of Portland cement clinker. 2,515,353. John J. Naugle.

Alkine-SO_3 addition product. 2,515,444. Allied Chemical & Dye Corp.

Reacting valine having an N-substituent of the formula-COX where X is an α-halogenated lower alkyl group, with pyridine, and reacting addition compound with acetic anhydride thereby forming a 2-alkyl-4-isopropylidene-5(4)-oxazolone. 2,515,465. Merck & Co., Inc.

Preparing 17-ketosteroids by reacting 20-keto pregnanes with alkyl-nitrite in the presence of a catalyst selected from anhydrous mineral acids, boron trifluoride, alkali metal alkoxides, alkali metal amides and alkali metal hydrides and hydrolyzing the formed oxime with a mineral acid. 2,515,482. Merck & Co., Inc.

Reacting 4-([(2-amino-4-hydroxy-6-pteridyl)methyl]formylamino)benzoic acid with formic acid and recovering 4-([(2-formylamino-4-hydroxy-6-pteridyl)-methyl] formylamino) benzoic acid. 2,515,483. Merck & Co., Inc.

Photochemical preparation of polypeptides by forming an aqueous solution of a diketopiperazine and an aliphatic peptide and subjecting to irradiation by ultraviolet light. 2,515,515. David S. Kahn.

Production of nicotinic acid by heating an admixture of 3-methylpyridine hydrochloride, chlorine and water. 2,515,593. Shell Development Co.

Production of 2, 4-pentadienoic acid by passing ketene into acrolein in the presence of sodium acetate. 2,515,595. Shell Development Co.

3-Amino-1,2 diphenyl-propanol-1. 2,515,700. American Cyanamid Co.

Treating tall oil to improve color and odor by heating with metallic zinc. 2,515,739. American Cyanamid Co.

Dehydroxylating castor oil by mixing the oil with water diluted sulfuric acid solution as a catalyst, and heating in a vacuum to remove volatilized matter. 2,515,797. Maytag Co.

Sulfonated 1,1,1-trichloro-2,2-bis(p-chlorophenyl) ethane. Ernest Segessemann and Nicholas M. Molnar.

In making tetraethyl lead by reaction of ethyl chloride on lead mono-sodium alloy, the improvement comprises carrying out the reaction in the presence of an aliphatic aldehyde. 2,515,821. E. I. du Pont de Nemours & Co.

Compounds having a carboxyalkylthio or a carbalkoxyalkylthio group bonded to silicon through hydrocarbon. 2,515,857. E. I. du Pont de Nemours & Co.

Producing secondary and tertiary amines, by contacting an aliphatic alcohol of from 1 to 20 carbon atoms and an aromatic amine containing at least one hydrogen atom bonded to the amino nitrogen atom, with bauxite containing between 4% and 22% of naturally occurring iron oxide. 2,515,872. Porocel Corp.

Arylaminomethine compounds selected from the group consisting of 4-keto-2-thiotetrahydro-oxazoles and 5-pyrazolones. 2,515,878. Eastman Kodak Co.

Alpha-(beta-ionylideneacetyl)-beta methyl glutaconic anhydride. 2,515,901. William R. Warner & Co., Inc.

Bis(hydroxyphenyl) compounds. 2,515,906. Gulf Research & Development Co.

Bis(hydroxyphenyl) alkanes. 2,515,907. Gulf Research & Development Co.

2-Methyl-5-phenylbenzothiazole and quaternary salts thereof. 2,515,913. Eastman Kodak Co.

3,4-Thiolanedithione. 2,515,927. Socony-Vacuum Oil Co., Inc.

Obtaining a valuable sulfur-containing liquid, by preheating sulfur and an aliphatic hydrocarbon of from 4 to 6 carbon atoms to yield tar, separating the tar, contacting the tar

with a low boiling organic solvent. 2,515,928. Socony-Vacuum Oil Co., Inc.

Halogenated derivatives of lysergic acid, isolysergic acid, and their derivatives. 2,516,002. Sandoz A. G.

Biphenyl compounds. 2,516,098. Parke, Davis & Co.

Ester-acetal of a polyhydric alcohol selected from the group consisting of glycerol, pentaerythritol and polypentaerythritols, in which at least two but not all of the hydroxyl groups of the alcohol have been acetalized in pairs by an aliphatic aldehyde or benzaldehyde and at least one of the other hydroxyl groups has been esterified by a resin acid selected from d-pimaric acid, levopimaric acid, abietic acids or Palkin acids. 2,516,104. Heyden Chemical Corp.

Compound selected from the group consisting of N-β-hydroxyethyl-N-2, 2, 2-trifluoroethylaniline and N-β, γ-dihydroxy-propyl-N-2,2,2-trifluoroethyl-m-toluidine. 2,516,-106. Eastman Kodak Co.

Compound selected from the group consisting of N-β-hydroxyethyl-N-2,2-difluoroethylaniline, and N-β, γ-dihydroxy-propyl-N-2,2-difluoroethyl-m-toluidine. 2,516,107. Eastman Kodak Co.

Aralkoxyalkylimidazolines. 2,516,108. Ciba Pharmaceutical Products Co.

Metal and phosphorus and high sulphur product produced by heating a phosphorus and sulphur-containing organic compound with a combining amount of a metal salt of carbon-sulphur acid of the class consisting of thiocarbonates and xanthates. 2,516,119. Continental Oil Co.

Preparing 7-hydroxyphenothiazone-3 by heating phenothiazine with sulphuric acid. 2,516,120. U.S.A. as represented by the Secretary of Agriculture.

Separating organic acids as their corresponding alkali salts from a mixture of water-insoluble oxygenated organic compounds. 2,516,127. M. W. Kellogg Co.

Naphthalene compounds. 2,516,130. Parke, Davis & Co.

Preparing N-carboanhydrides of alpha-amino acids by reacting thionyl chloride with the dialkali metal salt of a hydrocarbon alpha-carboxy-aminocarboxylic acid. 2,516,-145. E. I. du Pont de Nemours & Co.

Isomerizing para alkyl phenols to ortho alkyl phenols in the presence of a catalyst comprising silica gel activated by impregnation with alumina. 2,515,152. Phillips Petroleum Co.

Manufacture of compounds of the group consisting of acrylic acids and their salts and esters having a cyclic group attached to each of the α- and β-carbons. 2,516,153. Schering Corp.

Reacting an acrylic ester, an alkyl formate, and an alkali metal alcoholate to produce a product containing the corresponding α-(metallo-formyl)-β-alkoxy-propionic ester; condensing said reaction product with acetamidine or salts thereof to produce 2-methyl-4-hydroxy-5-alkoxy-methyl-pyrimidine. 2,516,158. Merck & Co., Inc.

Heating α-acetamido-β,β-dimethyl-acrylic acid with thioacetic acid, to produce N:S-diacetyl-dl-penicillamine; heating this product with a mixture containing acetic acid and dilute aqueous hydrochloric acid to produce dl-penicillamine hydrochloride; and reacting with pyridine to form dl-penicillamine. 2,516,240. Merck & Co., Inc.

Dextrorotatory stereoisomers of penicilloic acid G, 5,5-dimethyl-2-phenylacetamidomethyl-4-carboxy-thiazolodine, by reacting a compound selected from the group which consists of d-penicillamine with a compound selected from the class which consists of phenylacetamido-acetaldehyde and the dibutyl acetal. 2,516,251. Merck & Co., Inc.

3,11-diketo-20,21-dioxypregnanes. 2,516,258. Merck & Co., Inc.

Oxidizing 3,11-diketo-17-hydroxypregnanes with an agent selected from chromic acid, periodic acid, sodium periodate and lead tetra-acetate, to produce a mixture comprising 3,11,17-triketo-etiocholane and 3,11,20-triketo-17-hydroxy-pregnane. 2,516,259. Merck & Co., Inc.

Obtaining a stable, dry addition salt of an acid of formula HA with 3-amino-4-hydroxyphenylarsen-(anhydro)-oxide by freezing an aqueous solution of said salt and completely subliming away the ice under vacuum, A of said formula representing the anion of a non-toxic acid. 2,516,-276. Parke, Davis & Co.

Producing tetrasubstituted piperazines by hydrogenating a monoxime of an alpha-diketone in an organic acid medium and in the presence of a palladium catalyst. 2,516,289. E. I. du Pont de Nemours & Co.

Producing O-alkylimino ethers. 2,516,293. E. I. du Pont de Nemours & Co.

Fluorine-containing azo compounds. 2,516,302. Eastman Kodak Co.

Azo compounds containing fluorine. 2,516,303. Eastman Kodak Co.

Polyfunctional esters. 2,516,306. General Mills, Inc.

Synthesis of tryptophane. 2,516,332. General Mills, Inc.

Manufacture of 5-amino-1-pentanol by reacting 2-hydroxy-pentamethylene oxide with a mono- or dialkyl amine. 2,516,337. Sharples Chemicals Inc.

Recovering mannite from seaweed and fuci materials by extracting the material with water, reacting the mannite in the extract with an aliphatic carbonyl compound, hydrolyzing the tri-acetal-compound formed with a diluted acid, and separating the mannite so reformed. 2,516,350. Nils Andreas Sorensen and Kare Kristensen.

Separating beta and gamma-picolines from a mixture that is free from lutidines, by treating the mixture with phthalic acid in acetone; separating crystalline gamma-picoline phthalate and recovering pure gamma-picoline; treating the beta-rich filtrate with zinc sulphate solution to form complex compounds of the picolines; separating a crystalline complex compound of beta-picoline and zinc sulfate and recovering beta-picoline from the separated crystalline complex. 2,516,370. Upjohn Co.

Fluoromethylpyridines. 2,516,402. Purdue Research Foundation.

1-naphthoxy-2-chloro-1,1,3,3,3-pentafluoropropane. 2,516,403. Purdue Research Foundation.

Reaction product of hexachlorocyclopentadiene and chlorsulfonic acid. 2,516,404. Purdue Research Foundation.

Producing synthetic syringaldehyde, which comprises: (1) isomerizing 3,5-dimethoxy-4-hydroxyallylbenzene by heating in strong alkali to produce 3,5-dimethoxy-4-hydroxy-propenylbenzene; (2) oxidizing the product by heating with an oxidizing agent in aqueous alkali to produce syringaldehyde. 2,516,412. Sulphite Products Corp.

Extracting proteins by dissolving in a concentrated aqueous solution of a lower alkyl quaternary ammonium salt, separating the solution thus formed, regenerating the proteins by diluting the solution. 2,516,531. William J. Shibe, Jr.

N-dimethylaminoethyl-N-alkoxy-ethyl (or benzyloxyethyl)-anilines. 2,516,560. Socete des Usines Chimiques Rhone Poulenc.

In making a salt of an aromatic-oxy-aliphatic acid by reaction between salts of a chloroaliphatic acid and a phenol, the steps of forming an aqueous solution of a phenol, a water-soluble salt of a monochloroaliphatic monocarboxylic acid, and an alkali; heating, and adding alkali as necessary to maintain pH. 2,516,611. Dow Chemical Co.

Derivatives of dihydropyridine. 2,516,625. Shell Development Co.

Producing 2,2,4,4,6-pentamethyltetrahydropyrimidine, by reacting ammonia with acetone in the presence of an acidic condensation catalyst. 2,516,626. Shell Development Co.

In preparation of allyl acrylate by the condensation of acrolein in the presence of aluminum isopropoxide in an aromatic hydrocarbon solvent, the improvement comprises furnishing the acrolein reactant with iso-octane saturated with water. 2,516,627. Shell Development Co.

In preparing partial ethers of granule, cereal starch by direct alkylation with alkylene oxides, the steps of bringing into contact with granule, cereal starch an alkylene oxide in which the oxygen is linked to adjacent carbon hydrogen groups, and agitating. 2,516,632. Penick & Ford, Ltd., Inc.

In reacting unswollen, granule starch with an alkylene oxide in a water suspension containing a water-soluble salt of an alkali metal or alkaline earth metal and soluble alkali yielding a hydroxyl ion concentration promoting the reaction, and filtering and drying the starch. 2,516,633. Penick & Ford, Ltd., Inc.

Intimately dispersing soluble alkali in a material selected from the group consisting of an unswollen granule starch and a cereal starch dextrin and then gradually bringing into contact with a monofunctional epoxide of a lower aliphatic hydrocarbon. 2,516,634. Penick & Ford, Ltd., Inc.

5-(beta-bromoethyl) hydantoin. 2,516,635. Dow Chemical Co.

Preparation of ethyl chloride from ethyl alcohol by reacting liquid ethyl alcohol with hydrochloric acid in the presence of an aqueous solution of a metal chloride catalyst and in the presence of a volatile agent selected from the group consisting of benzene, cyclohexane, ethylene dichloride, trichloroethylene, and carbon tetrachloride. 2,516,638. Dow Chemical Co.

Organic peroxide having the general formula $(R_1)_3\,COOR_2$, wherein R_1 is an organic radical and R_2 is an alkene or cycloalkene radical. 2,516,649. Shell Development Co.

3,5-substituted 4,6-dimethyl-2-pyridones. 2,516,673. Wyeth Inc.

Substituted glycinamide. 2,516,674. Wyeth Inc.

Producing acetals of aldehydes containing at least four carbon atoms. 2,516,679. General Aniline & Film Corp.

Producing at least one of a monomeric acyl-substituted alde-

hyde and ketone by mixing a lower aliphatic alpha, beta-olefinic aldehyde and an aliphatic diketone having two ketonic carbonyl groups directly linked to a single carbon atom. 2,516,729. Shell Development Co.

Refining soybean oil, heating, separating lecithin, phosphatides, and fatty acids by passing an electric current through spaced electrodes, leaving a deodorized and decolorized soybean oil. 2,516,733. Henry M. Unschuld.

Semicontinuous production of tertiary olefinic monohydric alcohols corresponding acetylenic alcohols by partial hydrogenation of an aqueous solution of a tertiary monohydric acetylenic alcohol in the presence of a palladium catalyst. 2,516,826. Commercial Solvents Corp.

Catalyst which assists in the production of vanillin, residual sludge in a reaction mixture in which vanillin has been produced by subjecting lignin-containing substances in an alkaline copper sulfate medium to the action of a finely dispersed gas containing free gaseous oxygen. 2,516,827. Ontario Paper Co. Ltd.

Compound selected from the group consisting of 5-fluoronicotinic acid, alkali and alkaline earth metal salts of 5-fluoronicotinic acid, acid addition salts of 5-fluoronicotinic acids, 5-fluoronicotinamide, and acid addition salts of 5-fluoronicotinamide. 2,516,830. Eli Lilly and Co.

Compound selected from the class consisting of di-(2-carboxyphenylthio)-p-carbamido-phenylarsine, di-(carboxymethylthio-p-carbamido-phenylarsine, and the sodium, potassium, calcium and ammonium salts thereof. 2,516,831. Eli Lilly and Co.

Separation of crystals from solutions containing HCN. 2,516,882, American Cyanamid Co.

Paper & Pulp

Bleaching wood pulp containing ground wood fibers by preparing a wet lap from the pulp with alkaline peroxide bleaching solution, disintegrating the lap immediately and permitting the fibers of the disintegrated lap to bleach in the damp condition. 2,513,344. Buffalo-Electro-Chemical Co.

Bleaching sulphate wood pulp by treating the pulp sequentially, without intervening washing, with hypochlorite and chlorine and finally treating the pulp with chlorine dioxide. 2,513,788. Brown Co.

Bleaching moist felted groundwood pulp by impregnating with an alkaline peroxide solution which effects self controlled bleaching. 2,514,503. Buffalo-Electro-Chemical Co., Inc.

Paper free of frilling, for photographic purposes by surface sizing of waterleaf high α-cellulose paper with a composition consisting of aqueous starch, a water-soluble wet strength-imparting resin selected from melamine-formaldehyde and urea-formaldehyde resins and either citric or tartaric acid. 2,514,689. Eastman Kodak Co.

Hypochlorite bleaching of ground wood of the type rich in tanning and color bodies. 2,516,664. West Virginia Pulp and Paper Co.

Petroleum

Improved hydrocarbon synthesizing catalyst formed by spraying molten iron, containing a promotional amount of an activating material, onto spherical particles of aluminum. 2,512,608. Standard Oil Development Co.

Oil-well sealing compositions—water; hydraulic cement; a water-soluble, base-catalyzed, hardenable phenol-formaldehyde resin and a free water-soluble lower aliphatic aldehyde having not more than 6 carbon atoms. 2,512,716. Union Carbide and Carbon Corp.

Lubricant—mineral lubricating oil and a stable, non-corrosive product obtained by reacting ammonium hydrosulfide-hydrogen sulfide with an oxygen-containing organic compound. 2,512,784. Shell Development Co.

Lubricant composition comprising a major amount of a mineral lubricating oil and an amount of an ester of a monohydric alcohol and an oxidized sulfurized fatty acid sufficient to confer improved pressure carrying properties. 2,513,060. Gulf Oil Co.

Antioxidants for mineral oil lubricants by heating benzaldehyde or diethylaminobenzaldehyde or dimethoxybenzaldehyde, N-dimethylaniline and formaldehyde in the presence of an activated clay catalyst and recovering the condensation product. 2,513,061; 2,513,062; 2,513,063. Gulf Oil Corp.

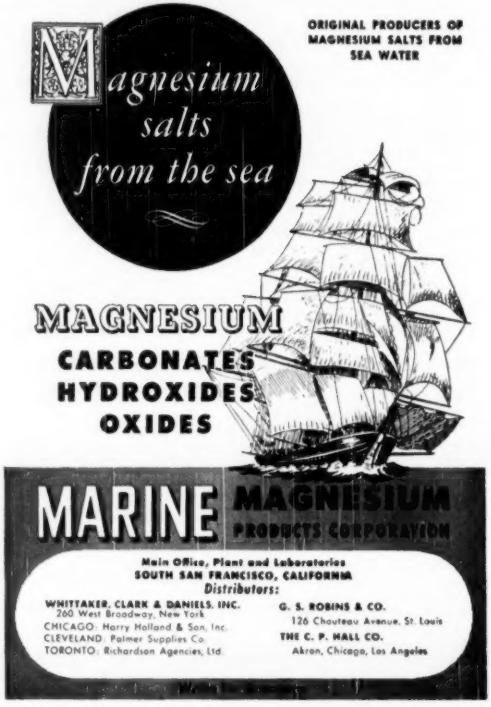
Isomerizing aliphatic paraffin hydrocarbons having at least 4 carbon atoms per molecule by contacting said hydrocarbons simultaneously with hydrogen fluoride and boron trifluoride in the presence of an added low boiling isoparaffin cracking inhibitor. 2,513,103. M. W. Kellogg Co.

Stabilized gasoline containing tetraethyl lead as anti-knock reagent and a lead salt of a fatty acid as stabilizing agent. 2,513,669. Anglo-Iranian Oil Co., Ltd.

Improved lime base grease composition—lubricating oil, lime soaps of fatty acids in grease forming amounts, a calcium salt of a monocarboxylic fatty acid having not more than 6 carbon atoms, and a lime salt of phosphoric acid. 2,513,680. Socony-Vacuum Oil Co., Inc.

In a cyclic process for the production of synthesis gas by the reaction of methane with a solid reducible metal oxide in the absence of steam wherein the reaction is periodically discontinued and the resulting reduced metal oxide is reoxidized, the improvement comprises effecting the reaction in the presence of an alkali metal oxide catalyzer. 2,513,994. Shell Development Co.

Lubricant comprising a mineral lubricating oil and a compound having the formula, $R_1\ R_2\ N-N=O$, wherein R_1 and R_2 are hydrocarbon radicals. 2,514,017. Shell Development Co.



Gasoline fuel comprising a leaded mixture of gasoline hydrocarbons and an N-nitroso di(aliphatic hydrocarbon) secondary amine. 2,514,018. Shell Development Co.

Lubricating composition normally relatively liquid and mobile which has the property of setting up to a solid grease consistency upon being subjected to mechanical working, consisting of a mineral lubricating oil containing grease-forming proportions of a soap-salt thickener prepared by mixing about one molar proportion of fatty acid of the C_{12} to C_{22} range, at least one-half molar proportion of C_2 to C_4 fatty acid, and an alkali metal hydroxide and heating to obtain a fine dispersion of said soap-salt in said oil. 2,514,286. Standard Oil Development Co .

Distillation of C_1-C_6 hydrocarbon mixtures. 2,514,294. Standard Oil Development Co.

Lubricating composition resistant to hydrocarbon solvents—a polyhydric alcohol having lubricating properties, selected from the group which consists of glycerine, C_1 to C_4 glycols and the lower monoalkyl ethers thereof, combined with water (to increase fluidity), zinc stearate, and a sulfonate type wetting agent which has a greater affinity for the surfaces being lubricated than said solvents. 2,514,296. Standard Oil Development Co.

Improved process for the noncatalytic conversion of a gaseous saturated hydrocarbon to a gaseous unsaturated hydrocarbon. 2,514,497. Phillips Petroleum Co.

It only takes a few minutes to learn the right steps!

DANCING IS EASY—once you learn what steps to take.

The same holds true for saving money for the future.

It will take approximately two minutes to find out how you can invest in either one of the two *automatic* plans offered by U. S. Savings Bonds.

Inquire at your place of business about the Payroll Savings Plan. Learn how easy it is to put aside savings for Bonds right from your paycheck.

Or, if you have a checking account, ask at your bank. They'll explain all about the Bond-A-Month Plan, in which you use your checking account as a means for investing in U. S. Savings Bonds.

So start finding out about them. Remember, it takes only two minutes today to learn how you can make your tomorrows a lot more carefree!

Automatic saving is sure saving—

U. S. SAVINGS BONDS

Contributed by this magazine in co-operation with the Magazine Publishers of America as a public service.

take the Hackney Cylinder Way to lower cost shipping of all types of gases

No matter what types of gases you ship—you'll find a strong, lightweight Hackney Cylinder especially designed for the job.

Designed with shippers' requirements in mind, they're lightweight to assure exceptional shipping and handling economies. Their rugged strength protects your product every minute—in storage and transit.

This outstanding light weight and strength are made possible by the Hackney Deep Drawing Process. This manufacturing method assures uniform sidewall thickness; eliminates excess material. Then, after complete fabrication, controlled heat-treating is employed to improve the physical properties still further.

Write for full details on Hackney cylinders—the cylinders that really protect your product and lower your cost doing it.

PRESSED STEEL TANK COMPANY

Manufacturers of Hackney Products

Main office and Plant: 1448 South 66th Street, Milwaukee 14, Wisconsin

Reaction with Phosgene Important in Manufacture Of Many Intermediates

U.S.I.'s Wide Experience With Phosgenation Reactions Available to Customers

U.S.I. production facilities and manufacturing know-how can result in substantial savings to chemical manufacturers who wish to take advantage of U.S.I.'s long experience with phosgenation reactions. The importance of phosgene as a reagent in the production of a wide range of intermediates is well known. The two reactive chlorine atoms in the molecule makes possible the ready coupling of other organic molecules while simultaneously introducing the keto structure. Alcohols react with phosgene to form chlorocarbonates (chloroformates) and these in turn react with alcohols to form dialkylcarbonates. Phenols similarly form chlorocarbonates and diaryl carbonates. The chlorine atoms of phosgene react with amines forming carbonyl chlorides which upon reaction with other amines yield substituted ureas. Aromatic hydrocarbons react with phosgene to yield ketones.

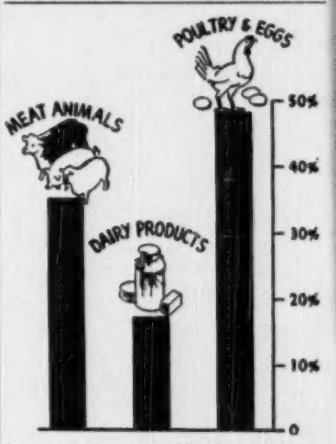
U.S.I. has long employed the first of the above reactions to produce ethyl chloroformate and diethyl carbonate. These materials are offered as regular products with rigid specifications. In addition, however, U.S.I. has a background of experience in laboratory, pilot plant and commercial scale on other products resulting from phosgenation reactions. Prospective users are invited to discuss with U.S.I. their requirements for such materials.

Fiber Properties Studied By New Micrograph Method

A host of fiber properties not studied by optical means, such as dyeing of the fiber, lustre, molecular orientation, and physical structure, can now be investigated by recently developed replica techniques for electron microscopy, a research scientist states. Some of the micrographs prepared by the new technique may be interpreted simply as direct, magnified images of obliquely illuminated surfaces, but they are actually radiographic images made by electrons transmitted through a very thin metallic film exactly duplicating the contours of the fiber surface, according to the scientist.

The appearance of oblique illumination is said to be achieved by evaporating a metal of high atomic number and condensing it onto the surface. In a sense, the scientist points out, the surface has been "illuminated" with a beam of metal atoms rather than light.

Superior Replicas Prepared



He states that until recently fiber replicas were usually prepared by making an impression of the fiber surface in a thermoplastic material followed by deposition of silica onto this mold with subsequent dissolution of the mold in a suitable solvent. For fibres which readily dissolve in organic solvents, however, superior replicas reportedly may be prepared by depositing the replicating film directly on the fiber.

U.S.I. APF Supplement Compares Favorably With Antibiotic APF Products

University Tests Show U.S.I. APF Supplement Gives Best Grade of Dressed Broiler of All Rations Studied

Farmers may now obtain uniform growth increases in farm animals which are fed rations containing an Animal Protein Factor supplement made by a primary fermentation process, it was reported by U.S.I. scientists at the recent fall meeting of the American Chemical Society.

This new product has been demonstrated in various laboratory tests to perform at least as well as other commercial materials, including APF supplements from antibiotic by-products. In addition, practical tests conducted at a leading university showed that the U.S.I. APF supplement gives the best grade of dressed broiler of all rations that were studied.

Increases over pre-war (1935-39 averages) in production of livestock and livestock products. The tremendous growth of the feed industry in the past ten years stems from these farm-production trends.

Graph courtesy of Feeds Illustrated—Prepared by Grantham Graphics

Similarly, at another prominent university, experiments on chicks demonstrated that the U.S.I. product can completely replace fish solubles in many practical formulations, and that it gives a better growth response than is obtained by the use of vitamin B_{12} alone.

Feed Booklets Available

A number of valuable U.S.I. booklets on feed are available to feed manufacturers: "The Road Ahead with APF and Antibiotics," "New Trends in Animal Nutrition," and "Proteins and Amino Acids in Animal Nutrition." For copies, write on company letterhead to the Editor, *U.S.I. Chemical News*.

Protruded Metal Packing Proves Highly Efficient

Comparative tests in distillation equipment indicate that new protruded metal packing is more efficient and economical than any of the previously known "efficient" packings. Key to the new packing's greater efficiency is its property of self-wetting on exposure to liquids, an advantage over types that require flooding for complete wetting.

Possible Use in Liquid Extraction

This automatic wetting property is not the same for all liquids with all metals. Protruded nickel packing, for example, is wetted by hydrocarbons but has almost no affinity for water. Research is anticipated to investigate the extent to which these differences can be used as driving forces in liquid extraction and similar processes. Experiments also indicate that the new packing produces good results in vacuum distillation.

Equipment Size Can Be Increased

The new packing's automatic wetting property is said to give it another advantage in that it suffers less from scaling up equipment size and increasing column diameter than any other packing known. Additional research on reflux distribution methods for large distillation columns is also reported to have produced very promising developments.

Find Antihistaminics Have Antifungal Action

A number of cases of athlete's foot are claimed to have responded to applications of a cream containing one of the antihistaminic compounds. Tests on this and another antihistaminic compound indicate that they possess properties which are inhibitory to pathogenic fungus species and that their activities are therefore not limited to the alleviation of allergic manifestations incited by these fungi.

Publishes New Booklet On Industrial Water Problems

Industrial water problems of all kinds—procurement, treatment, usage, and disposal—and the facilities for coping with them are discussed in a new booklet published by a Pennsylvania company.

Chlorophyll Found Useful In Peptic Ulcer Therapy

According to a recent announcement, a new chlorophyll preparation has been obtained which promises to become an important factor in the treatment of peptic ulcers. For some time it has been known that water soluble chlorophyll possessed tissue-stimulating action and that it promoted healing of chronic wounds. It has also been thought that this action could be used to advantage in the treatment of peptic ulcers, provided the chlorophyll could be brought into contact with the site of the lesion. Now, with the announcement of this new chlorophyll preparation, these requirements seem to be met.

Complete Healing in 58 Out of 79 Cases

A total of 79 patients with X-ray-proved duodenal and gastric ulcers were treated with this new chlorophyll preparation without the usual restrictions on diet, smoking, alcoholic beverages, or daily activity. Out of the total number of cases, 58 showed on X-ray examination complete healing in from 2 to 7 weeks. Furthermore, of the 58 cases showing complete healing, 20 cases had no recurrence of symptoms up to 11 months after treatment.

Issues New Bibliography On Container Coatings

A recently issued bibliography on container coatings is said to provide abstracts of some 150 patents and research papers on food and other types of container coatings, published since 1941. Author, inventor, and patent indexes are included.

New Booklet Offered On Phosphate Coatings

A valuable new booklet discussing the latest developments in Phosphate Coatings is now available. It contains 12 pages of detailed information on phosphate coating chemicals for use in paint-bonding, rust-proofing and protecting friction surfaces, and for improving drawing and extrusion.

Polyamide Resins In Water Suspension

Polyamide resins, widely used as heat-sealing adhesives and resistant coatings, are reported available now in water suspensions. A new process, in the pilot-plant stage at the present time, is said to overcome difficulties encountered previously in attempts to make water dispersions of the polyamides.

The new suspensoids are described as cationic and remarkably stable, and are claimed not to coagulate even when repeatedly frozen and thawed. They are heat-sealing and adhere firmly to most materials, according to the makers, and will fuse to become resistant to water, water-vapor, and oil. They are said to dry rapidly and will not block even under severe pressure. The suspensoids are reported available in two grades, one an essentially uncompounded suspensoid and the other modified for superior abrasion-resistance and for producing heat-seal bonds with improved stability at low temperatures.

New Collection of Reports On Utilization of Wood

A comprehensive collection of reports on wood utilization is reported available from the government. The collection is said to include 24 presentations dealing with wood research by the armed forces; the mechanisms of wood lignification and deterioration; utilization of wood for packaging; as a construction material in timber or "sandwich" form, and as conversion products; and wood requirements for aircraft, shipbuilding, and other fields. Some papers deal with fungus and insect problems, particularly with the marine borer.

Synthetic Albumen Process

A new Norwegian process for producing synthetic albumen from codfish waste has been announced. The product, claimed to contain 80 to 90 per cent pure protein reportedly can be used for baking, ice cream, mayonnaise, and pharmaceutical products, as well as in textile and paint industries.

TECHNICAL DEVELOPMENTS

Further information regarding the manufacturers of these items may be obtained by writing U.S.I.

"Liquid sandpaper," a chemical compound to replace sanding of surfaces before refinishing, removes wax, grease, and polish from hardwood floors and painted and enameled surfaces with a single wiping, according to the makers. It reportedly dulls gloss and provides a flat undercoat. **(No. 609)**

To protect against solvent fires involving ether, esters, acetone, alcohol, and related solvents, a new foam charge effectively covers and snuffs out flames in seconds, insulating threatened areas and preventing flashbacks, the makers claim. **(No. 610)**

A new snap-on spout for paint cans is said to permit faster stirring of full paint cans without slopping over edge and to make pouring easier. Spout is a natural resting place for the wet brush. Easy to clean, it reportedly may be used over and over. **(No. 611)**

A new-type light filter is claimed to block dingy red and yellow light from the rays of incandescent light bulbs. The filter, attached to a magnifier which nearly doubles light intensity, can be turned to any position on the bulb to focus light as needed. **(No. 612)**

To permit closed bin tops and bin storage of materials previously considered impossible to feed from bins, a new pneumatic device is claimed to provide direct action on bin contents rather than the bin, positive extrusions, easy installation, vibrationless operation, safety, and economy. **(No. 613)**

A new combination heatable flask and separatory funnel may be used, it is reported, for weighing, drying, dissolving, mixing, concentrating, precipitating, cooling, heating, melting, boiling, distilling, evaporating, decanting, and crystallizing without need of transferring to other flasks. **(No. 614)**

A new antiseptic liquid hand soap, developed for the special use of food handlers and industrial workers, is said to contain hexachlorophene to help reduce bacterial flora on the skin and an emollient and skin-softener to help lessen certain skin irritations caused by frequent hand washing. **(No. 615)**

A new portable 85° glossmeter, specially designed for measuring the sheen of interior wall paints and camouflage paints, is on the market. **(No. 616)**

A new liquid accelerator, miscible with water, can be added directly to natural or synthetic latex, the makers state. Films vulcanized with it are described as having high tensile strength and good aging properties. **(No. 617)**

New laminated tubing for the chemical and oil processing industries, made of glass fibers bonded with resins, is said to have the strength of steel and to be rust- and corrosion-proof. **(No. 618)**

321 STAINLESS

An Assured Supply Lower Cost Technical DATA*

*The assurance of a continuous supply of Titanium to make stabilized austenitic chromium nickel steel...plus the economic odvantage of the lower price of type 321 has focused increasing attention on its other outstanding features. Among these are excellent high temperature properties, thermal shock resistance and ease of drawing and forming.

In the "as-welded" state, as normally used, 321 shows a high order of corrosion resistance in a variety of corrosive media. It is being used effectively in many installations with type 347 weld rods used in welding.

* In developing the Low Carbon Ferro Titanium alloys used in making 321 stainless, TAM has acquired much worthwhile technical data. Therefore, although we do not supply steel, we can supply you with information of value. Write our New York City Office.

LOW TEMPERATURE METAL DEWAR VACUUM FLASKS . . .

SUPAIRCO

ALL-METAL CONTAINERS FOR LIQUEFIED ATMOSPHERIC GASES . . .

For use with liquefied gases or any extremely cold materials. Sizes: from ½ liter to 50 liters. Flasks are made of least porous metal, designed and built in accordance with accepted principles of low temperature refrigeration.

Supplied to hundreds of users in the U. S. A. and foreign countries for the past 20 years and considered by many to be the most efficient in design and construction. Immediate delivery of sizes up to 100 liters.

Make your own liquid air, nitrogen, or oxygen with a SUPAIRCO plant — specifications and prices on request.

3—36" x 36" Shriver Rubber Filter Presses, semi-hard 1½" rubber plates, rubber covered 3" cast iron frames; 4-eye, corner feed, closed delivery, washing type. Each 18 chambers. Each with 50-ton Seco closing device.

SPECIAL ITEMS FROM STOCK

1—Complete DRY ICE PLANT, capacity 50 tons per day, steam driven.

2—6' x 27' Davenport Rotary Steam Tube Dryers.

1—HOA 18" Raymond Screen Mill.

Baker Perkins Heavy Duty Disperson Mixer—stainless steel, 100 gal. working capacity hydraulic tilt, suitable for vacuum, with drive and 60 HP motor, complete.

2—Stokes Rotary Vacuum Dryers, 3' x 15' & 4' x 20', complete with Dust Collectors, Barometric Condensers & Pumps. Also 5' x 33' at our Shops.

10—No. 71 J. H. Day Co. "Roball" Sifters, single deck, screening surface 40" x 84", with STAINLESS STEEL SIEVE FRAMES, SCREENS, FEED AND DISCHARGE HOPPERS, etc., each with 2 H.P. Motor and steel stand. Used 3 times only.

2—DEVINE VACUUM SHELF DRYERS, 10 shelf, 40" x 43" single door, and 13 shelf, 59" x 78" double door.

2—6' dia. x 8' Oliver STAINLESS STEEL trough type continuous VACUUM FILTERS.

1—30" x 30" ALUMINUM PLATE AND FRAME FILTER PRESS. Sperry—43 chambers, side feed, open delivery, used on pectin. In excellent condition and for immediate shipment.

12—FILTER PRESSES. Cast Iron, 12" x 12", up to 42" x 42", open and closed delivery.

2—#12 SWEETLAND FILTERS, 36 leaves on 4", also 72 on 2".

1—J. H. Day Jacketed ALUMINUM Horiz. 1000# POWDER MIXER.

9—DIRECT HEAT ROTARY DRYERS: 3'6" x 24'; 4' x 30'; 4'6" x 40'; 5' x 30'; 5' x 50'; 6' x 60'; 8' x 60'; 9' x 85'; 11'6" x 120'. Also ROTARY KILNS up to 9'6" x 250'.

2—5'4" x 40' Ruggles Coles STAINLESS STEEL ROTARY DRYERS for direct heat or low temperature hot air.

SULPHUR

*Interesting Facts Concerning This Basic Raw Material from the Gulf Coast Region

*MINING

The process of mining sulphur, as developed by Herman Frasch, takes advantage of the fairly low melting point of sulphur (about 240° Fahrenheit). The process resolves itself into three parts: one, operating a power plant that heats and pumps to the field large quantities of water; two, distributing the hot water through wells to melt the underground sulphur, and raising the melted sulphur to the surface; three, cooling and solidifying the sulphur in large vats from which it is broken and loaded into cars for shipment.

The power plant and water reservoir, as well as the vats and permanent structures, are placed at some distance from the sulphur deposit to avoid possibility of damage from surface subsidence, resulting from extraction of the underground sulphur.

Loading operations at one of the huge vats of Sulphur at our Newgulf, Texas mine. Such mountains of Sulphur are constantly being built at our mines, from which shipments are continually made.

SHARPLES TRADE MARK CHEMICALS

THIS IS THE RIGHT TOOL FOR A HIGHLY SPECIALIZED JOB

. . . and

There's a RIGHT TOOL for making emulsions, too!

EMULSION technologists, like harness makers, need exactly the right tools to make the most of their skill. The harness maker needs this odd-looking "horse"—a special vise for holding leather as he cuts, punches and sews. The emulsion chemist needs exactly the right emulsifier to mix his oil and water or other dissimilar materials—or to perform some other function such as wetting or dispersing, penetrating or cleaning. He has dozens of emulsifiers to choose from, but picking the ideal is not so simple.

To assist the chemist in finding the *right* tool—the *right* emulsifier—for a particular job, Atlas evolved the HLB system of selecting emulsifiers. The Atlas HLB System, first of its kind, is based on the hydrophile-lipophile balance of each emulsifier and saves a lot of tedious experimentation.

Atlas makes scores of surface active agents, including the well-known SPAN and TWEEN emulsifiers, to fit the particular requirements of a host of different emulsifying, spreading, and penetrating applications. And we can build *special* emulsifiers to fit a specific need. Why not let us help with *your* emulsifier problems? Write for further information.

Span, Tween: Reg. U. S. Pat. Off.

ATLAS CHEMMUNIQUÉ

Paper Stays Soft With Sorbitol

Specialty paper makers have found that a 50-50 mix of sorbitol and urea keeps their product soft and absorbent through wide fluctuations in temperature and humidity. Added at 5 to 15%, based on the stock, either in the beaters or to finished paper, this method of conditioning shows exceptional results in such products as toilet paper, hand tissues, grease-wiping paper and glassine.

A Stearic Acid That Doesn't Oxidize

Hystrene stearic acids show no deterioration in color or odor on saponification or on aging after compounding—and that's great news to manufacturers of cosmetic creams and lotions, metal stearates and many other products. Now, for the first time, chemists are working with a commercial stearic acid containing virtually no unsaponifiables or unsaturates.

Sorbitol Makes Glues "Grab" Faster

A new Atlas research bulletin gives proof of outstanding advantages for sorbitol as a softener in flexible or non-warp glues. Sorbitol provides a higher tack or faster grab, combined with a longer tack time when desired. In addition, sorbitol can be used to step up tensile strength as much as 40% by comparison with glues made with other softeners, and more economical glues can frequently be made.

First New-Type

CHEMICO SULFURIC ACID PLANT

now in operation

The first plant, utilizing Chemico's new process for making sulfuric acid from sulfur, is now in successful operation at the Hamilton, Ohio works of the American Cyanamid Company. This new unit—rated at 50 tons per day can deliver sulfuric acid of any strength up to 95% H_2SO_4.

This new-type Chemico plant is basically simpler than conventional type contact sulfuric acid plants. The new process differs in these basic ways.

- It converts SO_2 to SO_3 in a highly efficient quench converter. This eliminates heat exchangers . . . assures higher yield from raw sulfur . . . virtually eliminates contamination due to unconverted SO_2.
- From the converter, the SO_2 gas mixture passes through a multiple dip-pipe absorption system, which operates by gravity flow. There is no need to distribute acid over packed absorbing towers.
- Water evaporation from absorber acid solutions removes heat of absorption and the sensible heat of hot gases. Only a small amount of cooling water is required for the product acid before storage.
- A built-in Pease-Anthony Venturi Scrubber insures mist elimination in the exhaust stack.
- Seven major items of equipment — usually found in present-type contact acid plants — have been eliminated: drying tower, gas filter, heat exchanger, SO_3 cooler, acid coolers, acid circulating and transfer pumps and diluting equipment.

THE RESULTS — The new-type plant is much smaller. It can be economically built and operated. Investment cost is lower per ton of capacity. Startup, shutdown and operation are easier. CC 807

Chemico plants are profitable investments

You can't beat these drums!

Your product may be one of the thousands of items for which a fibre drum is just about the perfect package. And there are some thumping good reasons why a Continental fibre drum is the best drum you can use.

Continental fibre drums can't be beat for rugged durability. They give extra protection to both expensive and dangerous articles for shipment either in this country or abroad. The closures are tight and strong —but easy to open and close.

Continental fibre drums can't be beat for shipping economy. Their light tare weight means savings at today's high freight rates—even greater savings on export shipments to countries where import duties are levied on the gross weight.

Continental fibre drums can't be beat for appearance. They are neat and trim, tailored to your product, and feature quality printing or spray painting. Each Continental drum is a style leader in its field.

Most important, Continental can't be beat for service. There are four strategically located Continental fibre drum plants ready to give you fast, economical and dependable service. Continental packaging engineers are always ready to give you sound advice on packaging problems. Backing up these engineers is a modern laboratory staffed with qualified research and development people.

Continental is big enough and flexible enough to handle any situation. Again and again Continental customers say, "You make us feel as though your fibre drum department is part of our own company." We'd appreciate an opportunity to show you how much real help and service we can deliver.

These drums can help you boom sales

1. The famous Continental LEVERPAK drum with its unique lever-locking device gives maximum protection under hard usage. 12- to 75-gallon sizes.
2. Continental FIBERPAK drum . . . a rigid, all-fibre container in ¾- to 67-gallon sizes.
3. Continental STAPAK drum. Has fibre body with metal top and bottom. Supplied in 2- to 32-gallon sizes.
4. Continental UPAK drum. Custom-made for the shipment of rolled materials.

Never a question about **UNIFORMITY** with ESSO SOLVENTS!

EXACTING modern refining treatments give Esso Solvents closely controlled uniformity for better processing. Esso Petroleum Solvents are being used more and more in such industries as paint . . . textiles . . . rubber . . . chemicals . . . food packaging . . . leather . . . many others — where uniformity is required.

INDUSTRIAL USERS *know* they can depend on Esso Solvents for purity and uniformity!

YOU CAN DEPEND ON ESSO SOLVENTS FOR

- **UNIFORMITY** – made in modern refineries from carefully selected crude oil sources.
- **ECONOMY** — closely-controlled quality gives constant, efficient industrial processing, high-quality products.
- **CONTROLLED EVAPORATION** — available in a wide range of evaporation rates with precise characteristics to meet your requirements.
- **SOLVENCY** — Esso aliphatics and Solvesso aromatics cover both high and low solvency ranges.
- **MODERN HANDLING METHODS** — separate tank storage, pumping lines, tank cars and trucks, are used in all Esso Solvent handling operations. Prompt, efficient delivery to your door is assured.
- **MULTI-STORAGE AVAILABILITY** — Water terminals in industrial centers.

Controlled high quality helps produce larger profits with versatile, dependable Esso Solvents.

Cowles CHEMICALS

DRYMET*

THE ECONOMICAL DETERGENT SILICATE

Cowles DRYMET, anhydrous sodium metasilicate, is the most highly concentrated form of sodium metasilicate available. It is more economical to use, on the basis of both Na_2O (alkalinity) and SiO_2 (silicate) than any other type of hydrated or anhydrous detergent silicate, either compounded or by itself. DRYMET contains no water of crystallization.

DRYSEQ*

THE ALL-PURPOSE DETERGENT SILICATE

Cowles DRYSEQ, anhydrous sodium sesquisilicate, is a medium pH alkaline cleaner which will do fast, dependable work at a low cost to the user. It is a white, free-flowing powder, quickly and completely soluble in hot or cold water—containing 56.75% Na_2O—making it an economical base material for compounding.

DRYORTH*

THE HEAVY-DUTY DETERGENT SILICATE

Cowles DRYORTH, anhydrous sodium orthosilicate, is a powerful, speedy, heavy-duty cleaner with valuable penetrating and wetting-out properties, reinforced dirt-removing power and unusual emulsifying action. It is an anyhdrous, free-flowing powdered silicate containing not less than 60% Na_2O, which may also be used as an economical constituent of high pH cleaning compounds.

We'll be glad to send you our DRYMET File Folder containing complete technical information and suggested formulations.

CRYSTAMET*

THE MEDIUM pH DETERGENT SILICATE

Cowles CRYSTAMET is a pure, perfectly white, free-flowing granular pentahydrate sodium metasilicate with the normal 42% water of crystallization. Suggested for compounding when it is desirable to lower the concentration of a finished product. Readily soluble—chemically stable—easy to handle. Can be used on medium pH jobs.

We take *Rare* organics out of the "rare" class for you

For some organics, a single kilogram may be enough to fill your production requirements for months. Or you may need ten kilos —or a hundred—of a compound or a purity grade in which world consumption has been no more than a hundred grams a year.

When your operations call for an organic hitherto regarded as "rare," ask Eastman to make it for you. Chances are that our long and diversified experience in supplying over 3300 compounds to the world's laboratories can bring down to the practical level the cost of the organic you need.

For more information and quotations send a list of your requirements to **DISTILLATION PRODUCTS** *industries,* Eastman Organic Chemicals Department, Rochester 3, N. Y. (Division of Eastman Kodak Company).

Chemicals with APPEAL

Aromatic Chemicals play an increasingly important role, not only in the field of chemistry and industry but practically in all facets of everyday living. Chemicals impart aesthetic importance and sales appeal. They have become an important adjunct of advertising, promotion and merchandising. Chemicals are utilized to make products look good, smell good, taste good and, quite often, feel good to the touch. Chemicals too, express and reflect the tempo and reality of the day like our literature or our movies or television.

For more than 150 years, Dodge & Olcott has devoted its research laboratories and its talents in the development of chemicals to improve American products and to give them greater appeal.

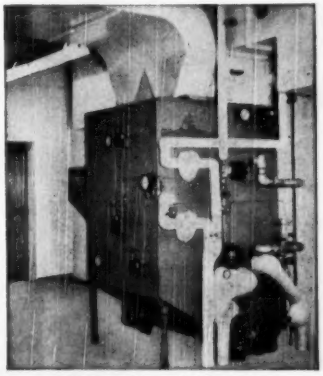
How You Save with the NEW Niagara Method of Air Conditioning

Using "Hygrol" Hygienic Absorbent Liquid

Because it absorbs moisture from the air directly, the new Niagara Controlled Humidity Method uses less, or no, mechanical refrigeration for dehumidifying. You save first costs and installing of heavy machinery. You save space, maintenance expense, power. You get easier, more convenient operation.



Using "Hygrol" hygienic absorbent liquid, this method gives complete control of temperature and relative humidity. Especially, it is a better way to obtain dry air for drying processes, packaging hygroscopic materials, preventing moisture damage to metals, and obtaining better quality for chemical process products and food products—or in obtaining better results in comfort air conditioning for office or laboratory at lower refrigeration costs.

NIAGARA CONTROLLED HUMIDITY METHOD — FLOW DIAGRAM

Food Packaging under Controlled Humidity

Niagara Controlled Humidity Air Conditioner

The diagram shows how filtered air is dehumidified by passing thru a spray of "Hygrol"—a liquid absorbent which removes air-borne moisture. This liquid is hygienic and non-corrosive: it contains no salts or solids to precipitate and cause maintenance troubles. It is continuously re-concentrated at the same rate at which it absorbs moisture, providing always the full capacity of the air conditioner, automatically.

Units provide a range of capacities from 1000 to 20,000 C. F. M. Multiple unit installations are in use successfully. Records of results are available. For further information, write Niagara Blower Co., Dept. CI 405 Lexington Ave., New York 17, N. Y.

CAN YOU USE LOWER COST

sulphuric acid?

• In many cases where high purity sulphuric acid is not necessary, tremendous savings can be realized through the use of an appropriate grade of spent acid.

An interesting additional advantage worthy of investigation is this: some products made with spent acid have better physical properties than those made with high-purity acid.

We handle hundreds of tons of spent acids every day. These acids vary widely from high quality to low acidity, and are priced in proportion.

Industries that require large tonnages of low cost acid should give careful thought to locating in the Gulf Coast area where this type of material is available in great quantity. Write to us for information concerning the strengths and grades of spent acid that are available. We shall be pleased to assist you.

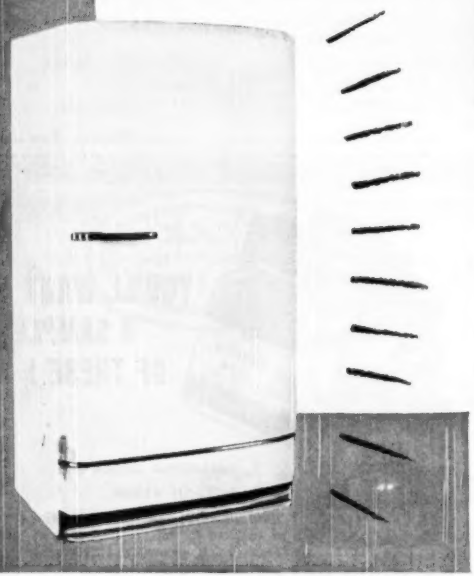
TENNANT PS

C. TENNANT, SONS & CO., OF NEW YORK

IT'S PURE, GLEAMING



WHITE

AND ALKYDS MADE WITH

Barrett*

PHTHALIC ANHYDRIDE

KEEP IT THAT WAY!

The superior purity of Barrett* phthalic anhydride makes its use especially desirable in the manufacture of better alkyd coatings where whiter finishes and perfect colors are required.

In the solid state, Barrett Phthalic anhydride has a pure flat white color with no tints of any primary color. This color is retained indefinitely.

In the molten state, Barrett phthalic anhydride is practically water-white or colorless, well within the limit of the standard specification of 55-Hazen established by the industry. In actual tests, it has remained within the limit of 55-Hazen when kept molten for more than 60 hours—a period of time well beyond any normal requirement for processing in plant kettles.

Barrett phthalic anhydride is shipped in 5-ply paper bags, even net weight 80 lbs.; and in light wooden barrels, even net weight 275 lbs.

We have prepared an interesting and most useful 48-page illustrated booklet entitled "Phthalic Anhydride." We will be happy to send you a copy with our compliments upon request.

At Last!
AN ELECTRIC MOISTURE TESTER THAT COVERS A W — I — D — E RANGE

New MODEL UNIVERSAL MOISTURE TESTER

GIVES DIRECT MOISTURE PERCENTAGE READINGS INSTANTLY ON A DIAL FROM 8½ to 40%
(Lower or Higher Ranges with the Use of Charts)

This New Model Universal Moisture Tester, now being extensively used in the grain, seed and feed industries is designed for all types of material.

- It is fully portable. Requires no electrical outlets or batteries.
- Built-in thermometer automatically indicates temperature of sample. No separate temperature tests.
- Complete test made in less than a minute.
- It is consistently accurate. Gives same reading repeatedly on same sample.
- It is thoroughly dependable. No maintenance.

GERSTHOFEN WAXES

(FORMERLY I. G. WAXES)

These high melting point waxes are free from impurities, have uniform specifications and offer you unique qualities that surpass the natural waxes. Nine types are available, one of which will surely meet your requirements. Their ability to improve quality, lower production costs, or both can be expected. Write for samples and information.

Like the Multiplication Table

In our chemical products, quality is a definite, precise factor. (The "quality" of a suit of clothes has innumerable variables. Our quality has none.) The almost mathematical and engineering phases of producing quality do not interest us half so much as the creative possibilities in the use of our chemicals and their derivatives. So we invite, with interest and in confidence any inquiry that deals with our products.

ACCULUTE

. . . for rapid, accurate preparation of Volumetric Solutions.

. . . Laboratories requiring speed and accuracy are using Acculute with excellent results.

ACCULUTE SAVES TIME – Open the ampoule – transfer the contents to a volumetric flask – dilute to volume (1000 ml) – your volumetric solution is prepared.

ACCULUTE IS RELIABLE – Close control of the special manufacturing processes insures uniformity of the product. Acculute does not vary in chemical content – you can depend on it.

ACCULUTE IS ACCURATE – Each ampoule contains the precise concentrated equivalent of the normality stated on the label. There is no need for subsequent standardization.

Caustic solutions are supplied in wax ampoules, others in chemically resistant glass.

Complete instructions for preparing Acculute solutions are furnished with each unit.

A special bulletin, listing Acculute concentrates with prices and discounts will be sent on request.

ACCUTINT

pH TEST PAPERS

Simple

Rapid

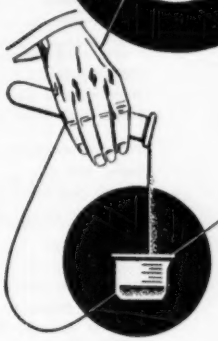
Accurate

Accutint is simple to use – just place a strip of the paper in contact with the substance to be tested and compare the color of the exposed portion with the master colors on the vial.

Accutint is rapid – it gives immediate results – no calculations are necessary – visual color comparison indicates the pH value.

Accutint is accurate – to 1 pH in the wide range paper and to 0.3 pH in the fractional range. Wide range papers are recommended where the pH value is not known to be within the limits of a fractional range paper. Fractional range papers are used for greater accuracy after the range has been determined.

S-65277 ACCUTINT TEST PAPERS. Packed in glass vials, each vial contains five pads or 100 strips. Color chart and instructions are included with each vial. Per Vial $0.65
Per 72 Vials ..... 10% Discount



S-65278 MASTER COLOR CHART. Illustrates color standards and readings for every pH value in each of the twenty-three wide and fractional ranges. Chart helps in the selection of the most suitable ranges or papers for a specific purpose. Each $1.00

READER SERVICE

HOW TO USE CARD

Mail the postcard below. Before mailing, circle page numbers of items about which you want more details. Then write your name and address on other side of card and mail to us. Your requests will be forwarded to companies concerned, the answer coming direct to you.

MAKES IT HANDY

Products and literature in this issue are listed on these pages. There are two indexes. (1) Editorial items on new products, new equipment, new literature; (2) products advertised. The index of advertisers is on the preceding page.

THE NUMBERS

Advertisements:—There is a page number on the postcard for each advertisement. Before the number, may appear, L, R, T, B (left, right, top, bottom), locating the ad on the page; small letters following (a, b, c) indicate additional products in the advertisement.

Editorial Items:—Numerals are page numbers; the ABC's distinguish among items where more than one is on a page. There is a number on the postcard for each item in three editorial departments: Equipment News, New Products, and New Literature.

FOR YOUR PROCESS NEEDS . . .

Oxalic Acid

From Coast-to-Coast Warehouse Stocks!

In buying Oxalic Acid, you can always depend on General Chemical for a superior product of consistently high purity and uniformity of crystal size. And you can also depend on General Chemical for prompt delivery from the company's chain of distributing points in America's industrial centers!

For production efficiency—and for economical operations—this combination of highest quality *plus* ready availability is of utmost importance to you. So be sure—for your needs, specify General Chemical Oxalic Acid!

For Removal of Rust and Iron Stains

As a Laundry Sour or Bleach

For Cleaning Railroad Cars and Buses

Bleaching Leather, Straw, Cork; Leather Tanning

For Radiator Cleaner Compounds and Metal Polishes

Textile Dyeing and Manufacture of Dyestuffs

For Electroplating

Production of other Chemicals and Plastics

GRADE: Colorless crystals thru 10 mesh. Contains a minimum of 99.5% $C_2H_2O_4 \cdot 2H_2O$

WITCO research
brings you 5 new products

You can count on Witco Research to come up with new chemicals that will help to improve your products. Here are just a few of the latest developments from the Witco research laboratories:

Stabilizers #40 and #70 Two outstanding new products for the stabilization of the effects caused by light and heat in vinyl resins.

Witco Disperso Zinc Stearate A *wettable* form of this usually water-repellent chemical. Now it is possible to make a finely dispersed water suspension by just adding Witco Disperso Zinc Stearate and gently agitating.

Witco 6% Calcium Naphthenate Gives high concentration metal content with less than A viscosity. It has unusually good compatibility with solvents, drying oils, and resins.

Witco Lacquer Grade Zinc Stearate #1 Has outstanding sanding qualities and maximum flatting, combined with good film hardness and minimum thickening on grinding.

Write to Witco *today* for more information on these new products.

Check your requirements against these WITCO products:

METALLIC STEARATES
VINYL STABILIZERS
PAINT DRIERS
ASPHALT & ASPHALTIC MASTICS
CARBON BLACKS
SUNOLITE (Anti Sunchecking Wax)

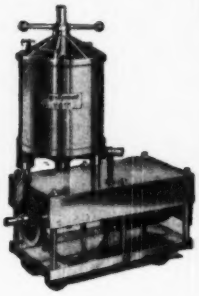
ALSOP FILTERS, MIXERS, and Stainless Steel TANKS

for dependable, low-cost time proven performance

Products of experience

For over 25 years manufacturing and processing plants have relied on the consistent high standards of Alsop Liquid Processing Equipment and on the technical services of Alsop engineers to help maintain efficient and economical production.



The Units shown here are only a few of a whole complete line of Filters, Mixers and Tanks developed to meet the varying demands of our many customers and our engineering staff is prepared to design special types which might be required to fit your specific job.

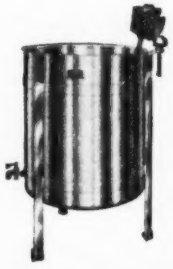
The diversity and completeness of our experience in Agitation and Filtration Engineering in all manufacturing and processing industries is available to you. Let us help you with your mixing and filtering operations. Call on us at any time, no obligation of course.

"Sealed-Disc" All Purpose Filters

Alsop "Sealed-Disc" Filters remove dirt, fiber, particles, etc. The Asbestos Filter Disc Elements insure a uniformly pure crystal-clear product but where ultra-fine filtration is not needed the Filter can be supplied to use ordinary filter paper.

Their simplicity, portability and compactness assures convenience and speed in operation and positive filtration results. They are available made of Stainless Steel, Monel Metal, Nickel-Plated Brass and Bronze or Iron and Steel in a wide range of sizes and capacities.

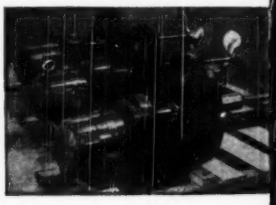
"Hy-Speed" Portable Mixers For All Liquids



We manufacture a full line of Portable Mixers for blending, dissolving and mixing or any type of processing where good agitation is necessary. The universally adjustable clamp makes for speed and ease in positioning the shaft and propellers for the best mixing action. The two propellers are also adjustable on the full length shaft.

These portable, easy-to-operate Mixers, available in size from 1/10 H.P. up to 5 H.P., make any tank a mixing tank. The solid acid-resisting shaft cannot collect liquid and cause contamination. Standard shafts and propellers are made of Stainless Steel.

Outstanding Mixing and Storage Tanks



We offer a complete line of sturdy 16 gauge Stainless Steel Mixing and Storage Tanks in sizes from five to three hundred gallons capacity. The all welded construction, rounded corners, and highly polished, crevice-free surfaces make them simple to clean and keep sanitary. We can furnish any of our Tanks with our new permanently mounted Mixer for a complete Mixing Unit. Our new bracket and clamp device makes it easy to fit the particular kind of agitation to your product and process. Mixers are available in direct drive or slow speed models. We can supply covers, valves and faucets of various types and sizes.

Sturdy, Efficient, Stationary, Agitators

We manufacture a complete line of Fixed-Side or Top-Entering Agitators. The shafts and propellers can be supplied made of Stainless Steel, Monel Metal, Nickel, Aluminum, Brass, Bronze, Iron, Steel and Special Alloys.

In addition to our adaptable semi-standard types, we are constantly called upon to design special combination units to meet exceptional applications. We urge you to call our engineers in on the preliminary stages of your planning.

Reader Service

An Expanded Service To You

To receive more information about any product advertised in the Buyers Guide, write your request on one of these easy-to-use cards. The result is . . . time saved for you, with no letters to write, and no postage required.

HOW TO USE

Fill in the product on which you want more information, the advertiser's name, the number of the page on which the ad appears — plus your name, position, and address. Mail the card to us. We tell the company of your interest and he replies direct to you.

This handy Buyers Guide is divided into distinct sections, each of which will be a valuable source of information to you—not only now, but in the future too. Keep it handy—you will have continuing use for it—and for the Reader Service cards.

INDEX OF ADVERTISERS

. . . . . PAGE 4

Here is a vital department for you—lists all the advertisers in the Guide—if you see a company's name there and read his ad and would like to know more about his product or service, just tear out one of the cards at the right, fill it in, and mail it.

CATALOG SECTION

. . . . . PAGE 8A

In this section are full page advertisements with descriptive treatment of chemicals and equipment that you may want to know more about—use a Reader Service Postcard.

CHEMICAL COMPANY DIRECTORY

. . . . . PAGE 9

Want to know what company makes a certain kind of chemical in a particular area? This part of the Buyers Guide gives you the answer. Notice the advertisements scattered through the pages—do you see something you would like to know more about? Send a postcard to us.

CHEMICAL INDUSTRIES Buyers Guide

Reader Service Department
McGraw-Hill Publishing Company
330 West 42nd Street
New York 18, N. Y.

CHEMICALS & RAW MATERIALS

. . . . . PAGE 49

In alphabetical order, here are the chemicals and raw materials — with the names of the companies who supply them. Use a card at the left to inquire about any products you see advertised in the ads liberally sprinkled up and down the pages. We will tell the company that you saw his ad and want additional information.

RESEARCH CHEMICALS

. . . . . PAGE 469

This new section consists of an alphabetical list of industrial research chemicals, both organic and inorganic, together with their manufacturers. Listings are limited to chemicals that are currently being produced in research quantities only.

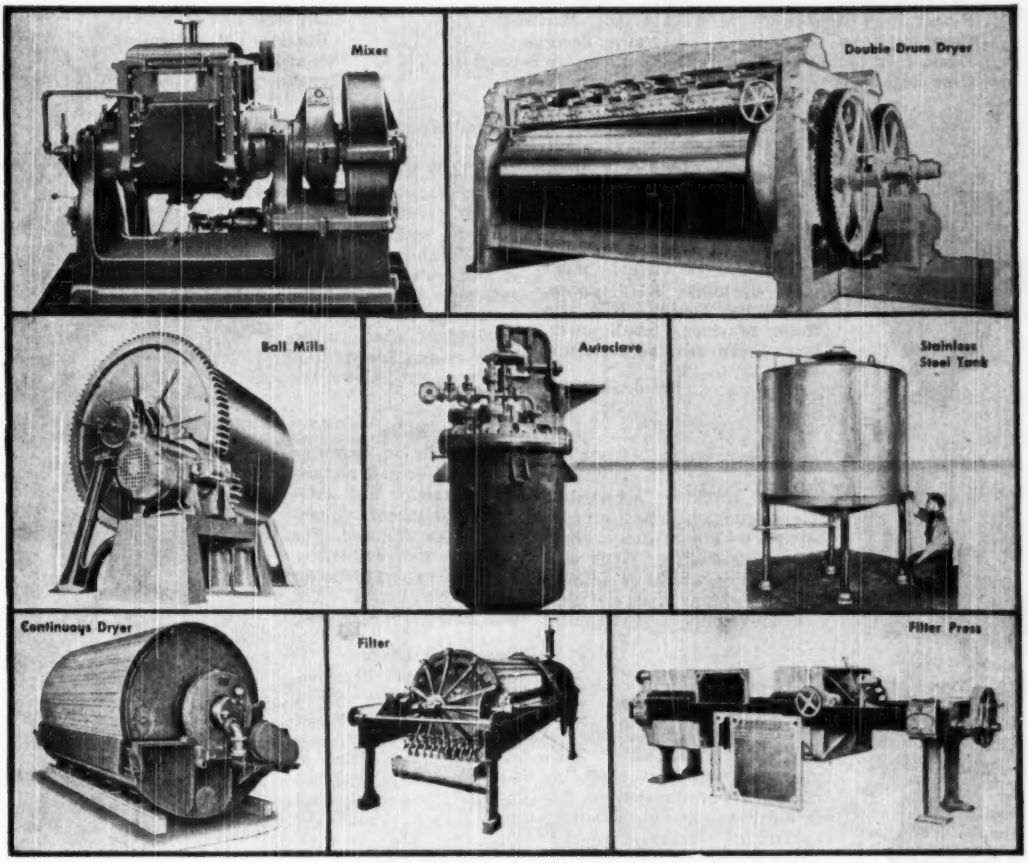
CHEMICAL SPECIALTIES

. . . . . PAGE 481

In this section are listed all the chemical specialties in alphabetical order, and all the companies supplying the specialties. Use the Reader Service postcards at the left to get more details on any product that you see advertised in this section.

EQUIPMENT AND CONTAINERS

. . . . . PAGE 619



Do you need some more information on the multitude of equipment and containers advertised here? The ads can be found in the pages of this section which list alphabetically the suppliers of this kind of equipment Just fill in the cards and we do the rest.

IN GENERAL . . .

You can use our Reader Service free postcards for any advertisement appearing in the Buyers Guide. This, of course, includes front, inside and back cover-ads as well as the ads in the individual sections. Let us do the work for you—fill out one of the cards and mail them in. We'll tell the companies your interests. They'll answer you direct.

R. GELB & SONS, INC.

USED and REBUILT PROCESS EQUIPMENT

A RELIABLE SOURCE FOR OVER 60 YEARS

SERVICE—The many prominent companies that have looked to "Gelb" for their much needed equipment are your guarantee of satisfactory service.

LARGE STOCK—The large and varied stock of machinery and equipment may be inspected at any time.

LIQUIDATION—The "Gelb" organization is prepared to render appraisals on single items or complete plants. Check with "Gelb" before making a final decision as to your liquidator.

We Are Prepared To Serve Clients In The Following Industries:

Breweries	Ceramic	Drugs	Glue	Paint & Lacquer	Plastics
Beverage	Cosmetic	Food Products	Ink	Paper	Soy-Beans
Chemical	Distilling	Fertilizer	Meat Packing	Perfume	Sugar
Canning	Dry Colors	Gelatin	Oil	Petroleum	Varnish

WE BUY COMPLETE PLANTS OR SINGLE ITEMS

R. GELB and SONS, INC.

UNION, NEW JERSEY EST. 1886 UNionville 2-4900

STURTEVANT MILL COMPANY

8 Harrison Square, Boston 22, Mass.

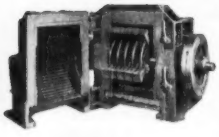
Reduction, Separating, Conveying and Processing Machinery

Jaw Crushers
Rotary Fine Crushers
Crushing Rolls
Hammer Mills
Ring Roll Mills
Rock Emery Mills
Laboratory Machines
Vibrating Screens
Mechanical Air Separators
Bale Pulpers, Paper
Mixers
Dry Batch
Dustless Batch Blenders
Den and Excavator
Elevators

Services: Consulting, Designing and Erecting Engineers

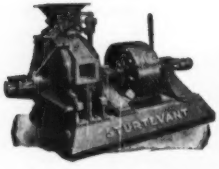
Air Separators

for finest separation of dry materials. Range of work 40 to 400 mesh. Capacities ¼ ton to 50 tons per hour. Large feed opening, steep cones, rigid construction, Ball and Roller bearings. Small power, low upkeep, easy adjustments. Sizes: 3′ to 18′.



Moto-Vibro Screens

screen anything screenable. Classified vibrations. Unit construction—any capacity. Open door accessibility. Open and closed models with or without feeders. Many types and sizes —range of work ½″ to 60 mesh.

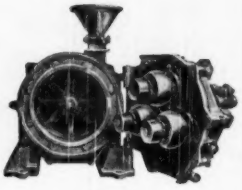


Rotary Fine Crushers

for intermediate and fine reduction. (1″ to ¼″.) Open door accessibility. Soft or moderately hard materials. Efficient granulators. Excellent preliminary Crushers preceding Pulverizers. Many sizes. Belt or motor driven.

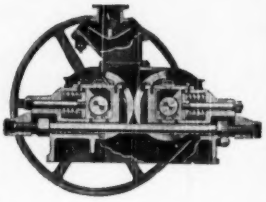
Swing-Sledge Mills

for coarse and medium reduction. (1″ to 20 mesh.) Open door accessibility. Soft, moderately hard, tough or fibrous substances. Built in several types and many sizes.



Fine Pulverizers

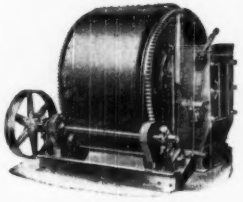
built in both Vertical and Horizontal types. For grinding soft and moderately hard materials to a fineness of 40 to 300 mesh.



Ring Roll Mills

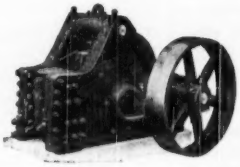
for medium and fine reduction (10 to 200 mesh) hard or soft materials. Very durable, small power. Operate in closed circuit with Screen or Air Separator. Open door accessibility. Many sizes, large or small capacities. No scrapers, plows, or shields.

Crushing Rolls



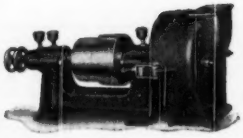
for granulation, coarse or fine, hard or soft materials. Precision and automatic adjustments. Crushing shocks balanced. For dry or wet reduction. Sizes 8x5 to 38x20. Roller Plain bearings. The standard for abrasives.

Dry Batch Mixer



for intimate blending. Batch type. One opening only for intake and discharge. Open door accessibility. Many sizes, ¼ to 2 tons—Large outputs. Simple, Compact, Easy Running, Practically Dustless. With or without batch hoppers.

Also Dustless Batch Blenders.



Jaw Crushers

for coarse, intermediate and fine reduction of hard or soft substances. Heavy or light duty. Cam and Roller action. Special crushers for Ferro-alloys. Several types, many sizes.

Laboratory Machinery

Jaw and Rotary Crushers, Rolls, Hammer Mills, Disc Pulverizers, Screens, Air Separators, Coal Crusher and Sampler, Vibrating Test Sieves.

Open-Door Elevators, Conveyors, Bins, Chutes, Spouts, Special Machinery, Built to Order

Chemical Industries

What this Section Contains

Catalog Section

Catalog and full page advertisements of suppliers of chemicals and equipment.

Chemical Company Directory

Geographical listings of names and addresses of manufacturers, importers and local distributors of chemicals, specialties and raw materials sold in the United States.

Chemicals and Raw Materials

Over 3,000 chemicals and raw materials with formulas, chemical and physical properties, synonyms, principal uses, with a list of manufacturers, importers and local distributors.

Research Chemicals Section

List of 2900 industrial research chemicals, both organic and inorganic, together with their manufacturers. Limited to chemicals that are currently being produced in research quantities only.

Chemical Specialties

Chemical specialties for textiles, leather, paper, ceramics, etc., with a working definition and list of manufacturers and distributors for each product.

Technical and Statistical Data

Useful factors of conversion for weights and measures. Tables of standard pipe dimensions.

Chemical Prices

The annual high and low prices of chemicals and raw materials covering the years from 1939-1949.

Associations and Societies

A comprehensive list of trade, technical and scientific organizations in chemical and allied fields.

Equipment and Containers

Comprehensive, where-to-buy-it directory of equipment, instruments, apparatus, containers and other supplies commonly used by the chemical and process industries. Includes an alphabetical listing of names and addresses of manufacturers and other suppliers.

Brand and Trade Names

The most complete alphabetical list of brands and trade names ever published in the chemical and allied fields—gives the maker, address and the use for each product.

FOR BUYERS GUIDE SECTION:

Publisher: W. F. Traendly Editorial Director: S. D. Kirkpatrick

Publication Staff: Editor, W. Alec Jordan; Executive Editor, R. L. Demmerle; Managing Editor, Margaret M. Acer; Consulting Editors: Howard C. E. Johnson, Herman W. Zabel, John J. Craig, Ralph R. Schulz; Production, Marilyn J. Hoffner.

Business Staff: Sales Manager, B. E. Sawyer; Business Manager, A. E. Weis; New York, L. C. Todaro, Wm. B. Hannum, Jr., Richard F. Burkhart; Chicago, Frank C. Mahnke, Jr.; Dallas, J. H. Allen; Atlanta, R. C. Maultsby; Los Angeles, Carl Dysinger; San Francisco, John Otterson.

PRICE OF THIS SECTION $2.50

Published monthly at 1309 Noble St., Philadelphia 23, Pa., and entered as 2nd class matter July 15, 1944, at the Post Office at Philadelphia 4, Pa., under the Act of March 3, 1879. How to cover the Chemical Industries ...

COMPLETELY — EFFECTIVELY — ECONOMICALLY

IT'S A BIG MARKET

The chemical process industries are basic, still-growing and *stable*. They buy:

Raw Materials	$7,242,000,000
Maintenance Materials	281,000,000
Fuel and Power	498,000,000
Containers	305,000,000
Transportation	350,000,000
Supplies and Services	159,000,000

COVERAGE THAT COUNTS

In the process industries, 1,843 plants produce more than $1 million worth of materials annually; 2,978 plants fall into the $500,000 category.

CI will take your sales message into 3,552 plants estimated to represent 76 per cent of the industries' total purchasing power.

Here's a breakdown of calculated coverage industry-by-industry:

Textile Processing	61 %
Pulp and Paper	34
Paints, Varnish, Colors	74
Animal and Vegetable Oils	37
Drugs, Medicines, Toilet Preparations, Insecticides	81
Soap and Glycerine	96
Rayon and Allied Products	97
Hardwood Distillation, Naval Stores	45
Fertilizers	31
Industrial Chemicals	96
Miscellaneous Chemical Products	97
Petroleum Refining	81

CONCENTRATED BUYING AUDIENCE

CI's highly selective (ABC) circulation is aimed not at the mass but at the market. A certified survey has established that each copy of CI has an average of 2.77 readers (active audience: 29,400) and that 73.2 % of these readers buy, specify or recommend the purchase of chemicals, equipment, containers, raw materials.

EDITORIAL SCOPE

CI is edited for the active, responsible leaders of the chemical industries. It is designed, specifically, to provide these men—the industries' planners and doers—with the essential information they must have in concise, readable, understandable form.

Editorially, CI is not concerned with the abstruse and the highly theoretical; it does stress what new technical developments mean *economically*, their overall significance and import, how they will affect markets, processing techniques, packaging procedures, etc. CI is practical, useful, usable.

How well do CI's industrially-experienced editors do their job of weighing, appraising, interpreting, integrating, featuring? Here's one criterion: This year CI won Industrial Marketing's highest award for outstanding editorial achievement.

CI commands the reader interest of the important people you want to reach.

It forms a potent, productive vehicle for your sales message.

LOW COST CONTINUITY

Want to sharpen your pencil and figure how you can talk to this husky, stable industry *often enough* and *regularly enough* to get your share of the $8.8 billion it spends annually? Here's how:

You can get in touch and keep in touch with CI's purchase-potent readers on a very modest budget. Twelve full pages in black and white—keeping the industry reminded *every month of the year* of you and your products costs only $2,100. Economical, effective continuity. Real coverage.

It *costs less* to be represented in CI every issue than in any other monthly or weekly publication in the field.

Let's talk about your problem, your opportunity, what we can do for you. Write, phone or wire.

FREE:

Is your company listed as a source of supply in this edition of CI's BUYERS GUIDE — the industry's most complete and widely used reference and buying directory? Whether you advertise or not you are entitled to ten FREE listings under the product classifications you select.

Drop us a line and we'll make sure you are represented in our next edition. No obligation, of course.

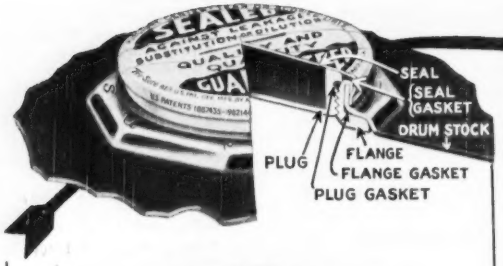
AMERICAN FLANGE & MANUFACTURING CO. INC.



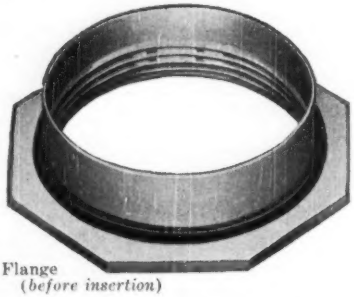
30 Rockefeller Plaza, New York 20, N. Y.

Tri-Sure Products Limited, St. Catharines, Ontario, Canada

Tri-Sure

Reg. U. S. Pat. Off.

CLOSURES



The Seal

The Plug

The Flange
(*before insertion*)

The Tri-Sure Closure* was designed to meet the demands of oil and chemical companies for a soundly-engineered sealing device which would safeguard liquids in drums from the hazards of transit.

Today the Tri-Sure Closure is used in more countries, by more companies, and for more products than any other closure—because it is recognized as the most reliable means of ensuring the delivery of the exact quantity and quality which the shipper puts into the package.

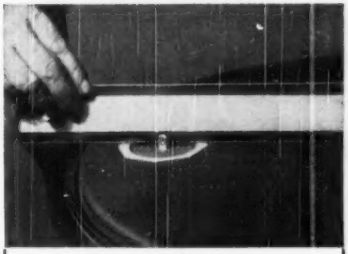
The Tri-Sure Closure provides a margin of safety which far surpasses the requirements of the average container:

Safety from Leakage and Seepage
Safety from Internal and External Pressure
Safety from Breathing-in and Contamination
Safety from Pilferage and Substitution

This multiple assurance of safety is achieved by the perfect inter-engagement of three precisely-formed parts—a flange, a plug and a seal.

THE FLANGE**

The Tri-Sure Steel Flange is inserted as an integral part of the drum stock—as strong as the drum itself. An octagonal seat formed in the drum stock receives the octagonal base of the flange. The neck of the flange fits snugly within the collar of the drum stock, which extends upward from the octagonal seat. The extending end of the neck is curled tightly over the free end of that collar, thus strongly compressing the flange gasket, and drawing the base of the flange up into its octagonal seat. This exclusive Tri-Sure assembly resists rotation, distortion and leakage.



THE PLUG**

The Tri-Sure Plug fits securely into the flange to effect a tight closing. The plug is die-cast from a high-grade die-casting alloy, enabling its dimensions to be maintained within close tolerance. The gasket seat is exactly formed, and its relationship to the plug threads is exactly maintained. The result is that Tri-Sure Plug gaskets seat with perfect uniformity and efficiency.

Tri-Sure Plugs are available in three sizes—2", 1½", and ¾"—all with holes for wire-sealing. The 2" and 1¼" plugs are provided with either eyelets or threaded adapters on their bases to receive faucets. Pressed steel plugs are also available, in the same sizes as the die-cast plugs.

THE SEAL

The Tri-Sure Seal is made of 195-lb. plate. With its own cork gasket, it forms a leak-proof, air-tight covering for the closure, which prevents breathing-in, intake of dust, and seepage. When the seal is applied, with the special sealing tool, the skirt of the seal is pressed in against the neck of the drum stock, and extends practically to the base of that neck, so that the seal cannot be pried off without destroying it, making undetected tampering, pilferage or substitution impossible. Scored lines on the seal make its authorized removal an easy, quick operation.

Tri-Sure Full Drainage Saves 8.34 Ounces In Every Drum

The base of the Tri-Sure Flange is perfectly flush with the inside of the drumhead. This flush fitting of the flange is an invaluable feature, as it assures full drainage, and the saving of considerable gallonage from waste. Tests have shown that drums fitted with Tri-Sure Closures drain an average of 8.34 more ounces. Calculated on the basis of a 10,000 55-gal. drum shipment, the consumer will recover over 650 gals. which would otherwise remain in the drums.

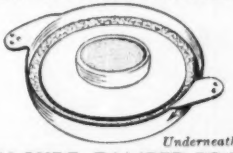
Tri-Sure Seals can be supplied with your name, trademark or other insignia—designed and lithographed in full color to your exact specifications. These customer-designed seals provide attractive product identification, and many hundreds of private designs are now in use in the United States alone.

PLAY SAFE—BY SPECIFYING "TRI-SURE CLOSURES" ON DRUM ORDERS

Any drum manufacturer, in any country, can supply you with drums equipped with Tri-Sure Closures. A Tri-Sure Flange is inserted as an integral part of the steel container body at the time of manufacture. Precision dies for this operation, supplied by our company, are in the plants of all drum manufacturers. Just specify Tri-Sure Closures to your supplier, and your drums will be delivered with flanges and plugs; you apply the seals.

Specify Tri-Sure Closures in every drum order, as an expression of the pride you take in your product—and as proof to your customers that every gallon in every drum is protected from leakage, seepage, tampering and pilferage.

**The "Tri-Sure" Trademark is a mark of reliability backed by 28 years serving industry. It tells your customers that genuine Tri-Sure Flanges (inserted with genuine Tri-Sure dies), Plugs and Seals were used.*



***2" flanges and plugs manufactured with American and also British (Whitworth) Thread.*

NEW TRI-SURE PRODUCTS

TRI-SURE SIDE-SCORED SEAL

This new seal, embodying wings and side-scoring, marks an outstanding achievement in ease of removal—at the same time retaining the same high quality and positive protection that are exclusive with Tri-Sure Seals. Like all Tri-Sure Seals, it gives protection from leakage, seepage and pilferage.

Underneath View

TRI-SURE TAMPER-PROOF VENT CAP

This vent cap and seal assembly is made especially for liquids which build up pressures. Regardless of the position of the drum, a filter permits gases to escape through vents in the seal, but will not allow the product to pass. The filter can be supplied to suit liquid viscosity. Two-inch size only.

TRI-SURE ROLLED THREAD STEEL PLUG

This new Tri-Sure Steel Plug embodies rolled threads and a new type of extremely strong wrench lugs. It is a unit of exceptional strength, yet is much lighter in weight than the standard Tri-Sure Steel Plug, and functions as easily and efficiently as the widely used Tri-Sure Zinc Plug.

CHEMICAL PLANTS

BISHOP, TEXAS
NEWARK, N. J.

Leading producer of Paraformaldehyde (flake), Formaldehyde, Acetaldehyde and Acetic Acid, as well as many other standard and special organic chemicals.

More than 18 years of planned research together with the most advanced plant facilities enable Celanese to meet the changing needs of chemical markets.

Consider these advantages:

- VOLUME SUPPLY OF QUALITY CONTROLLED ORGANIC CHEMICALS
- ASSURED CONTINUITY OF SUPPLY THROUGH ABUNDANT RAW MATERIAL SOURCES
- LOWEST POSSIBLE PRICES TO INDUSTRY
- DISTRIBUTION AND STORAGE FACILITIES AT STRATEGIC LOCATIONS
- CONTINUOUS RESEARCH AND DEVELOPMENT

KINGSPORT, TENNESSEE

TITANIUM ALLOY MANUFACTURING DIVISION
NATIONAL LEAD COMPANY

Executive Offices
111 Broadway, New York City
General Offices, Works and Laboratories
Niagara Falls, N. Y., U. S. A.

TAM ZIRCONIUM TITANIUM PRODUCTS
Registered U. S. Pat. Off.

Resident Development Engineers
Niagara Falls — Cleveland
New York City — Columbus
Plainfield, N. J. — Bethlehem, Pa.
San Francisco — Chicago
New Philadelphia, Ohio

Titanium Alloy Mfg. Division are pioneers in the development of both elements . . . Titanium and Zirconium. For over 40 years, all the resources and efforts of this company have been devoted to exploiting the alloys of Titanium and the compounds of Zirconium and Titanium. With the cooperation of the technical staffs of many customers, researchers and members of the field staff have originated major applications in over 20 industries.

ZIRCONIUM COMPOUNDS

The possibilities and uses of ZIRCONIUM and its compounds in industry are extensive and increasingly larger. At the same time, current developments in progress point to still further expansion of the various products now used successfully in large quantities in the manufacture of Refractories, Electrical Resistors, Dye Extenders, Water Repellents of Textiles, Catalysts, Abrasives, Vitreous Enamel and Glaze Opacifiers, Toners, etc.

TAM Zirconium Metal—Atomic weight of Zirconium is 91.22—specific gravity 6.4. The atomic heat varies from 6.07 to 7.31 at temperatures ranging from 0° to 100° C. Melting point of the metal has not been accurately determined due to probable variation of the purity of the metal under observation and has been reported from 1529° to 1700° C. Zirconium is quadrivalent. Its atomic number is 40 in the periodic system. It has a great affinity for oxygen and at elevated temperatures combines readily with nitrogen, phosphorus, sulfur, the halogens and the like. Zirconium has value as an oxygen getter and is used in flashlight bulbs, as an Oxygen and Nitrogen getter in radio broadcasting and vacuum tubes. The metal is of interest in the above Energy program and due to its high resistance to acids, in chemical equipment, etc.

Zirconium Oxide ZrO_2—Color, white—Specific gravity about 5.6—Melting point about 2700° C. Ignited Zirconium Oxide (fused) is practically insoluble in all mineral and organic acids except Hydrofluoric and concentrated H_2SO_4. It is insoluble in aqueous solutions of alkaline reagents. It will form Zirconates when dissolved in molten caustic alkalies of certain chlorides. It is relatively insoluble in many glass compositions. It has a high refractive index and in some forms a fair hiding power. It is powerfully cantoluminescent.

These properties make Zirconium Oxide commercially important as an opacifier in ceramics, in super refractories, and as a pigment in certain synthetic resins. Research with this compound also indicates high ultra violet repelling properties.

Stabilized Zirconia exhibits excellent thermal shock properties. This advantage plus the very high melting point (4600° to 4700° F) makes it an outstanding refractory for high temperature applications. The development of Stabilized Zirconia is of recent date and data covering its resistance to various alloys, metals, atmospheres, etc., have not been fully determined. Cooperative research is invited.

Zirconium Silicate (Zircon) $ZrSiO_4$—Hardness 7.5—Color, mainly colorless—Index of refraction 1.93 B—Dispersion 2 V 10°—Crystalline Tetragonal—Cleavage 110 rare—specific gravity 4.65—Melting point between 2200°-2300° C., coefficient of expansion is low. Zircon is a good electrical insulator at elevated temperatures and imparts good heat shock resistance in such bodies. Zircon is practically insoluble in all mineral and organic acids. It is unaffected by aqueous solutions of alkaline reagents, either hot or cold. The mineral is decomposed by alkaline fusions.

These properties, among others, make Zircon valuable in industries such as ceramics, heavy chemicals, super refractories, abrasives, dental and high temperature casting cements, mold and core washers, and electrical resistance compounds. Zircon refractories are used in considerable quantities in industries such as phosphates, aluminum refining, precious metals, etc. Crucibles made from this compound exhibit high heat shock resistance. Titanium Alloy Mfg. Division produces Zirconium Silicates of various purities for various uses.

Zirconium Silicate (Zircon) Refractories—These refractories are used in the manufacture of meta phosphates, aluminum refining, platinum and other precious metal melting, high temperature burner block applications and for many other special purposes.

They operate safely up to 2000° C., exhibit good heat shock and abrasion resistance properties and resist the action of various acids and acid slags.

A complete line of standard and special shapes is manufactured.

Zirconium Silicate (Zircon) Electrical Cements—These cements are used in increasing quantities for electrical insulation of heater units such as strip heaters, flat irons, stove units, etc., because they exhibit exceptionally low operating and humidification leakages and extremely fast returns to normal after humidification tests are completed.

In dry press Flat iron insulation, for instance, TAM Cement type A shows an operating leakage of 0.002 M.A., a standard humidification test leakage of 0.2 M.A., and a return to normal in from 15 to 30 seconds.

In mud cast electrical elements TAM cement type B shows an operating leakage of 0.02 M.A., on humidification 0.5 M.A., with a return to normal in from 10 to 15 seconds.

TAM Zirconium Oxychloride $ZrOCl_2+8H_2O$—Color, cream white—Soluble in water. Stable if kept at temperatures below 80° C. When heated above that temperature, hydrochloric acid is liberated, and when calcined ZrO_2 remains. Alkali metal carbonates first precipitate the Zr as hydroxide which dissolves in an excess to form Zirconium Carbonate. This compound is stable only when cold. If heated, Zirconium Carbonate decomposes yielding the hydroxide.

Ammonium Carbonate precipitates the hydroxide which dissolves in excess reagent to form the soluble carbonate. In presence of organic acids, the precipitation of Zirconium hydrate with alkalies can be hindered or prevented.

Phosphoric acid and soluble phosphates precipitate Zirconium phosphate. A saturated solution of tannic acid precipitates Zirconium Tannate.

Zirconium oxychloride as well as the sulphate is the basis from which other Zirconium compounds now used in catalysis, water repellence, manufacture of lakes, dye extenders, etc., are precipitated.

Zirconium Acetate, $ZrOOC_2H_3O_2 \cdot HC_2H_3O_2$.—This compound is furnished in solution form and finds application in water repellent treatment of textiles and in the manufacture of color lakes.

This and other TAM Zirconium compounds are used in water repellent treatment of various types of textiles and produce superior repellence when tested by both standard hydrostatic and spray methods.

Zirconium Sulphate $Zr(SO_4)_2+4H_2O$—Color, practically colorless—the compound is soluble in hot water. The chemical behavior of Zirconium sulphate towards other reagents is approximately the same as the oxychloride.

Space does not permit mentioning the properties and uses of other Zirconium compounds manufactured by the Titanium Alloy Mfg. Division such as Zirconium Nitrate, Carbide, Tetrachloride, Sodium Zirconium Silicate, Potassium and Barium Zirconium Silicates, Stearate, and many others.

Chemical analysis and properties will be gladly furnished.

TAM RESEARCH CO-OPERATION

TAM laboratories at Niagara Falls contain extensive facilities for research and control along chemical, metallurgical and ceramic lines. Of equal or greater importance is the unique precision equipment maintained for experimental work and the testing of finished products.

The benefits of this modern specialized research are available to industry through a practical engineering staff constantly at work in the field. Qualified by training and experience, these men have the knowledge that makes their assistance in working out problems in your plant especially valuable.

TAM TITANIUM PRODUCTS INCLUDE

TITANIUM COMPOUNDS

Titanium compounds are finding a variety of uses in industry today for such applications as welding rod coatings, scavengers of steel, carbide tools, electrical condensers, acid resisting ceramic coatings and others.

Titanium Metal—Atomic weight 47.9, specific gravity 4.5, atomic heat 0.1462 at 0° to 100° C. and 0.1563 at 0° to 333° C. The melting point is between 1785° and 1800° C. The atomic number is 22 in the periodic system.

Titanium combines with oxygen at about 600° C. and burns in nitrogen at 800° C. When hot, it combines with sulfur, carbon, phosphorus, boron and silicon.

Titanium is readily soluble in hydrofluoric and nitric acids and dissolves slowly in concentrated hydrochloric and hot concentrated sulphuric acids. Titanium Metal due to its high mechanical strength, light weight and high melting point is becoming of increasing interest as a structural material and as an alloying element in high temperature resisting alloys used in jet propulsion. Titanium metal finds use as an alloying addition in copper alloys and in electronics.

Titanium Alloys—Titanium alloys such as low, medium, high carbon Ferro Titanium, Iron and Steel Foundry are used in large and increasing quantities as carbon stabilizer of stainless steels and porcelain enameling iron and as alloy additions. Some of these alloys find volume application as steel cleansers and deoxidizers and as grain refiners and graphitizers of cast iron.

Alfam, a 50% Titanium containing Aluminum Alloy, is used for Titanium incorporation in master Aluminum Alloys, while alloys such as nickel and manganese Titanium find application in weld rod coatings and as alloy additions.

Titanium Carbide TiC—This compound is very hard, has high abrasive value and its melting point and behavior toward other reagents are similar to the properties of Titanium Cyanonitride. TiC finds an ever increasing application in the carbide tool industry.

Rutile—A Titanium Oxide mineral, found in various parts of the world, finds considerable application in welding rod coatings where it, in conjunction with other compounds, aids in the stabilization of the arc, speed of welding, proper slag formation, and in the production of welds of satisfactory elongation, density, strength and endurance. Rutiles are also used as staining compounds by the Ceramic Industry.

Titanium Alloy Mfg. Division produces Rutiles containing from 79% to 94½% Titanium Oxide, all of them of exceptional purity and uniformity.

Titanates—Titanates manufactured by the Titanium Alloy Mfg. Division, such as sodium, potassium and calcium, find increasing uses in welding rod coatings, and the Titanates of barium, calcium, strontium & magnesium are used in large quantities in the manufacture of radio condensers, electrical resistors, etc.

Titanium Tetrachloride $TiCl_4$—This compound is commercially the most important Titanium Chloride and is used in smoke screen applications, sky writing, aluminum metal refining, and experimentally in catalysis.

$TiCl_4$ is a colorless (commercial grade amber with reddish tint) transparent liquid. The specific gravity is 1.76, melting point 25° C. and boiling point 136.4° C. $TiCl_4$ hydrolyzes readily in the presence of moisture and forms basic chloride or titanic acid and hydrochloric acid. $TiCl_4$ reacts readily with many organic substances.

TAM Titanium Cyanonitride—Color, silvery gray, specific gravity about 5.0, melting point in reducing atmosphere over 2750° C. Heating to red heat imparts a variegated range of beautiful surface colors.

Various other Titanium and Zirconium compounds are manufactured and available for many applications too numerous to mention. Complete data and information sent on request.

A carefully technical trained field staff located in various parts of the country are at your service at all times.

**TAM is a registered trade mark*

11 STRATEGIC POINTS
for Service and Supply

MERCO

EACH of these is a warehouse point from which prompt truck deliveries and shipments are made . . . complete supplies and specialized equipment of well known brands and manufacturers . . . plus skilled technical advisory service when and where desired.

it's too late

for this edition.
But, if you sell to the chemical process industries, you can be represented in our upcoming revision.

We can list your company under the products you sell.

It will help us make the Buyers Guide even more complete. And it will help the thousands of buyers who use the Guide in the U. S. and 58 foreign countries to route their inquiries, place their orders.

What to do? Just drop us a line and tell us about your main products.

Chemicals and Raw Materials

An alphabetical list of chemicals and natural raw materials, with their formulas uses, physical and chemical properties, as well as a buyer's guide of manufacturers and distributors.

NOTE: Chemical Industries has compiled the best information obtainable from manufacturers concerning their products. However, no responsibility can be accepted for these claims.

ABRASIVES FOR DETERGENTS, POLISHES, etc.

Materials with gentle abrasive action which clean or polish without marring the smooth surface of brass, silver and other soft metals, enamels, glass, marble, etc. See: Bentonite Diatomaceous Earth, Talc, Tripoli, Volcanic Ash, etc.

ACETALDEHYDE

99% Minimum

Used in condensation reactions to produce resins, rubber accelerators and antioxidants. Also used in production of dyestuffs, pentaerythretol, cinnamic aldehyde, ethyl lactate.

Prompt shipment in 325 pound net steel drums and 52,000 or 64,000 pound net tank cars.

acetic anhydride

• Eastman acetic anhydride is widely used for acetylations requiring a stronger reactant than acetic acid. Its high quality and uniformity recommend its use also as a dehydrating agent in reactions such as nitrations and sulfonations where the removal of water is necessary. Available in drums and tank cars.

acetone

Because of its excellent color and odor, Eastman acetone is desirable for use as a process solvent for extraction of drugs and food products. It is soluble in water, alcohol, ether and chloroform. Available in drums, compartmented and full tank cars.

ACETONYL ACETONE

$CH_3(CO)CH_2CH_2(CO)CH_3$. A colorless, water-sol. Liq. B.P. 191.3°C. Solvent for cellulose acetate, with a xylene nitrocellulose dilution ratio of 1.8. A small per cent. reduces the viscosity of nitrocellulose and Vinylite resin solutions. Being a 1,4-diketone, it condenses with reagents to form ring compounds which are derivatives of furan thiophene, and pyrrole, thus providing a simple method for passing from open chain to cyclic compounds. Has a tanning effect on hides and skins.

acetic acid GLACIAL

INDUSTRIAL GRADES OF EXCEPTIONALLY HIGH QUALITY

• Eastman glacial acetic acid is characterized by its uniformly high quality. It is well suited for use as a raw material for many organic synthesis and as a reaction medium and solvent. Eastman glacial acetic acid is soluble in water, alcohol and ether. Available in tank cars quantities.

crotonic acid

• Since crotonic acid possesses a system of conjugated double bonds, it looms as an important raw material for the plastic and surface-coating industries. Its alkyl esters form interesting copolymers with most of the usual vinyl compounds. Reacted with paint oils, crotonic acid or its esters increase weathering resistance. Crotonic acid has also been used as an intermediate in the preparation of synthetic vitamin A. Available in fiber-drum lots.

ACID FORMIC (Acid Hydrogen Carboxylic, Acid Methanoic)

HCOOH. Colorless liq., pungent odor. Sp. gr. 1.2178. M.P. 8.3°C. B.P. 100.8°C. Sol. water, alcohol, glycerin, ether. Uses—mfr. formates, organic esters, oxalic acid, aromatic formates; silvering agent; deliming agent; preserving hides; mordant in dyeing and printing textiles; fermentation assist; in electro-plating; in medicine. Grades—tech.; U.S.P.; also various strengths in solution.

Heyden

FORMIC ACID and SODIUM FORMATE

Heyden Formic Acid, 90% and 85%, serves in many fields, including textile, leather and chemical manufacturing. Shipped in 125 lb. carboys and 500 lb. stainless steel drums.

Sodium Formate finds use in dyeing, tanning and production of water-resistant wallpaper. Shipped in 300 lb. fiber drums.

Technical details on request.

ACID, beta-HYDROXY NAPHTHOIC (3-Hydroxy-2-Naphthoic Acid)

$C_{10}H_6OHCOOH$. Yellow rhombic leaflets. M.p. 217.5° to 219°C. Sol. alcohol and ether. Uses—dyes. Grade—technical.

Beta Hydroxy Naphthoic Acid
"B. O. N."
The Carwin Company specializes in the manufacture of quality intermediates.
Other Products include:
Beta Hydroxy Naphthoic Acid
Dichlorbenzidine and Dianisidine
Benzidine and o-Tolidine
THE CARWIN COMPANY • NORTH HAVEN, CONN.
Phone: New Haven 2-2161

beta oxy naphthoic acid (BON)

• Eastman beta oxy naphthoic acid is characterized by uniform high quality. Widely used as an acetate black developer, it also serves as a raw material for the manufacture of various naphthol couplers. Available in drum lots.

TENNESSEE EASTMAN CORPORATION
(Subsidiary of Eastman Kodak Co.)

ACID MOLYBDIC (Molybdenum Anhydride, Molybdenum Trioxide)

H_2MoO_4. Composition variable. White or yellow powd. Sp. gr. 3.1124 (18°C.). Loses water at 70°C. Slightly sol. water. Sol. ammonia, alkalies. Uses—mfr. molybdates, molybdenum salts, molybdenum metal as catalyst; blue pigment in ceramic glazes; paint pigment; laboratory reagent; electro-coloring metals; in medicine. Grades—85% pure; C.P., about 99.5% MoO_3; tech.

ACID NITRIC (Aqua Fortis, Hydrogen Nitrate, Acid Azotic)

HNO_3. M.W. 63.02. Colorless or yellowish, fuming liq. Sp. gr. 1.502. M.P. —42°C. B.P. 86°C. Miscible water. Uses—mfr. sulfuric acid, metallic nitrates, aqua regia, phosphoric and oxalic acids, nitro derivatives of benzene, naphthalene, anthracene and derivatives, synth. drugs, camphor, azo, diazo and aniline dyes, nitroglycerine, Berlin blue, nitrocellulose, nitrostarch, T.N.T., picric acid, hats, Celluloid, rubber, rubber substitutes, rayon; as nitrating and pickling agent; laboratory reagent; metallurgical solvent; assist in dyeing silks; separating gold and silver; gilding brass; engraving and etching steel; electro-plating; dyeing furs; in engraving; in medicine. Grades—U.S.P.; C.P. (Sp. gr. 1.403); commercial: 44,42,40, 38, 36 deg. Baume: Aqua Fortis in same strengths; C.P

ACID PHOSPHORIC (Orthophosphoric Acid)

H_3PO_4. Colorless, syrupy liq. M.W. 98.04. Sp. gr. 1.834. M.P. 42.35°C. Sol. water. Uses—mfr. phosphates, intermediate chemicals, hydrogen peroxide, glycerophosphates, pharmaceuticals, dyes, incandescent light filaments, pyrotechnics, ammonium phosphate fertilizers; as acidulating agent in jellies, essences, soft drinks and mineral waters; laboratory reagent; pickling and rustproofing agent; latex coagulant; ceramic vitrifying agent and flux; sugar defectant and clarifier; mordant in dyeing and printing textiles; brightener of silks; in engraving; in medicine. Grades—tech. (50%); 75%, 85% paste and syrup; U.S.P. syrupy (90%); U.S.P. dilute (10%); Pure Food Grade (50 to 75% H_3PO_4); glacial sticks; C.P.

PHOSPHORIC ACID

85% USP Syrupy

Made from pure Elemental Phosphorus of our own production. Meets all USP and U.S. Pure Food requirements. Special corrosion-resistant equipment for handling and storage maintains purity to delivery. Prompt service from convenient shipping points.

STEARIC ACIDS

Unlike usual "stearic" acids (which contain less than 50% stearic acid) are Armour's fractionally distilled Neo-Fat stearic acids:

NEO-FAT 1-60 (75% stearic) affords uniform high quality at reasonable cost. Used in rubber, stearates, buffing compounds, greases, etc.

NEO-FAT 1-65 (90% stearic) offers maximum stearic acid concentration. A superior raw material for metallic soaps, cosmetics, pharmaceuticals, rubber compounding, hard greases, chemical synthesis.

ARMOUR
ARMOUR *Chemical* DIVISION
1355 W. 31st Street, Chicago 9, Illinois

ACID STEARIC (Acid Cetylacetic, Acid Stearinic, Acid Octodecylic-n, Stearophanic, Acid Octodecanoic)

$CH_3(CH_2)_{16}COOH$. M.W. 284.28. White, odorless amorphous. Natural. Sp gr. 0.847. M.P. 69.3°C. B.P. 383°C. Sol. alcohol, ether, carbon bisulfide, carbon tetrachloride, chloroform. Slightly sol. water. Uses—mfr. stearates, stearate driers, cosmetics, soaps, pyrotechnic compositions, candles, shoe and metal polishes; in medicine. Grades—saponified; distilled; single, double; triple pressed; U.S.P.

AHCO

Hystrene* Stearic Acid

means highest purity in 3 ways

1. Controlled uniform concentrations of true stearic acid from 70% to 97%.
2. Unsaponifiable matter below 0.2%.
3. Iodine value below 0.5.

Exceptionally high color stability at elevated temperatures... particularly suitable for soaps, esters and other derivatives.

ACID SULFURIC (Dihydrogen Sulfate, Oil of Vitriol, Battery Acid, Dipping Acid, Oleum, Hydrogen Sulfate)

H_2SO_4. Colorless to dark brown, oily liq. Sp. gr. 1.8342. M.P. 10.46°C. B.P. 210-238°C. Sol. water. Uses—mfr. inorganic and organic acids, nitric and hydrochloric acids, technical gases, hydrogen, hydrogen sulfide, carbon dioxide, sulfates of metals, hydrogen peroxide, alums, salt cake, synth. drugs, synth. perfumes, halogens, dyes, T.N.T., picric acid, smokeless powd., gun-cotton, nitroglycerine, sol. cotton, nitro-starch, nitro-sugar, stearin, fatty acids, liq. glue, yeast, mineral pigments, parchment paper, celluloid and pyroxylin plastics, candles, soap, glucose, syrups and refining sugar, rayon; as sulfonating agent in making intermediates and organic chemicals; fungicide; laboratory reagent; pickling agent for iron and steel; drying agent; mordant in dyeing and printing textiles; sour in bleaching cottons; resist in dyeing woolens; in storage batteries and ordinary cells; purifying fats and oils; solubilizing superphosphates; dehydrating foods; recovering ammonia as ammonium sulfate; neutralizing lime in glue making; tanning; refining precious metals; electroplating; cleaning bronze and brass; electrolytic refining of copper; metallurgy of cobalt, nickel, magnesium and other metals; washing tars; refining crude oils and petroleum products; photographic processes; process engraving; refining waxes; reclaiming rubber; recovering fatty acids; carbonizing wool; mercerizing cotton; in medicine. Grades—commercial, 66, 60, 50 deg. Oleum, 60%, 40%, 20%, 98% acid; Fuming Sulfuric, U.S.P., U.S.P. dilute (10%); C.P.

DAVISON

Inorganic Acids

SULPHURIC ACID (H_2SO_4)

Contact Acid—Commercial grades: 60° Bé.; 66° Bé. and 98%; various commercial grades of Oleum up to 40%.

(*Shipment: Facilities for loading tank cars or barges.*)

HYDROFLUOSILICIC ACID (H_2SiF_6)

Technical grade; colorless fuming liquid, highly corrosive. Approximately 25% H_2SiF_6.

(*Shipment: In rubber-lined tank cars and rubber-lined drums.*)

USES

In ceramics; disinfectant of brass and copper vessels in breweries; technical paints; wood preservatives; impregnating compound and in electrolytic refining of lead.

Further information will be furnished upon request.

ACID SULFUROUS

H_2SO_3. Colorless, suffocating liq. or gas. Gas constants. Sp. gr. 1.43368. M.P.—76.1°C. B.P. 10°C. Sol. water. Uses—mfr. intermediates, sulfites, bisulfites, hydrosulfites, alums, salt cake, sulfuric acid, flour, food products, sulfite liquors; as preservative fruits, nuts, foods and wines; laboratory reagent; refrigerant in ice machines; fire extinguisher in mine fires; in bleaching fats, oils, silk, wool, straw hats, wicker work, sponges, feathers, furs, plumes; softening hides; tanning; smelting and refining ores; disinfecting ships; refining crude oils and paraffins; refining and bleaching sugar; in medicine. Grades—tech.

Announcing

. . . General Mills Aliphats

General Mills Aliphats are fatty acids of high purity and uniformity. They are processed by fractional distillation of crude mixed fatty acids at General Mills' new Chemoil Plant at Kankakee, Illinois.

Aliphats are available as pure acids or in special combinations for specific technical requirements. We invite your inquiries. Write today for details, and technical service.

ACIDS PHOSPHINIC

$RPHO_2H$. Kerosene phosphinic acid contains a phosphorus-to-carbon linkage and is derived from the hydrocarbons contained in kerosene. It is a brittle, glassy solid of low melting point, soluble in most common organic oxygenated solvents. Benzene phosphinic acid has a characteristic phosphine-like odor. They have possible application as insecticides and fungicides as well as other applications characteristic of organic phosphorus compounds.

C_2H_5OH. M.W. 46.05. Colorless liq., ethereal, vinous odor. Sp. gr. 0.789 (20°C.). M.P. —117.3°C. B.P. 78.4°C. Sol. water, methanol, ether. Uses—mfr. intermediates, esters, organic derivatives, synthetic drugs, chloroform, iodoform, ether, acetic acid, alcoholates, phenacetin, antipyrine, dyes, smokeless powd., food preparations, sheep dips, plant washes, artificial leather, margarine, motor fuel, incandescent mantles, solid alcohol, anti-freeze solutions, carbon removers, cleansers, polishing compositions, dipping fluids, artificial flowers, essences, hats, cartridges, cements, composition billiard and pool balls, spirit varnishes, enamels, paint removers, perfumes, cosmetics, toilet preparations, lubricating compositions, photographic papers and plates, Celluloid, plastics, rubber cements, disinfecting soaps, liquid and transparent soaps; as fulminate; cordite; solvent in extracting essential oils; preservative and solvent in condiments; illuminant; laboratory reagent; preservative for animal and plant specimens; general solvent; solvent and extracting medium for resins and waxes; solvent in making artificial rubber and rayon; in cleaning; polishing; etching; soldering; coloring and lacquering metals; refining petroleum; dyeing and printing; silvering mirrors; in medicine. Grades—U.S.P.; Cologne spirits; absolute. 188, 190 proof; 96%.

ALCOHOLS

Methanol, Ethanol (ethyl alcohol), Isopropanol, Butanol, Methyl Amyl Alcohol, Allyl Alcohol, Ethylbutanol, Hexanol, Heptanol, Ethylhexanol, Undecanol, Tetradecanol, Heptadecanol and Trimethylcyclohexanol are commercially available from Carbide and Carbon Chemicals. All of the specially and completely denatured formulas of Ethanol are produced, including the anhydrous grades and a proprietary solvent, trade-marked "Synasol." The alcohols are shipped in 55-gallon containers, compartments, and straight tank cars. For further information write for our catalog, "Alcohols."

ALCOHOL HIGHER FATTY

Produced from natural fats or oils by reducing the fatty acids to the corresponding fatty alcohols. Alcohols most commonly used are cetyl, oleic, stearic, lanolic, laurel, oleyl and cholesterol. In the manufacture of the so-called "soapless soaps" these alcohols are then reacted with sulfuric acid, and the alcohol sulfate is neutralized with caustic soda to form the fat alcohol sulfate. See also sodium laurel sulfate. Uses—

ALCOHOL HIGHER FATTY (cont'd)

for the soap, in the place of ordinary soap in textile, laundry and general cleaning; in shampoos, etc.; as dyeing and printing assists.

ISO-OCTYL ALCOHOL

Clear, colorless liquid, miscible with most oxygenated and hydrocarbon type solvents. Principally used for production of esters which function as plasticizers for vinyl resins and nitrile type rubbers, as a lacquer and resin solvent, antifoam agent, and in the manufacture of detergents and wetting agents.

SECONDARY BUTYL ALCOHOL

Clear, colorless liquid among medium boiling group of solvents. Solvent for lacquers and resins, component of hydraulic fluids, coupling agent. Employed in the preparation of esters, secondary butyl xanthate, methyl ethyl ketone.

PETROHOL (Isopropyl Alcohol)

Marketed in 91%, 95% and 99% concentrations. Clear, colorless liquid, completely miscible in water. Used in antiseptics, astringents, emulsions, lotions, shampoos, tonics, cosmetics, bactericides, sterilizers, rubbing compounds, reagents, crystallizations, drugs, food products, cleaning agents, phenolic resin thinner, nitrocellulose dehydration, nitrocellulose coatings. Raw material for acetone, esters, isopropyl ether.

ALDOL (Acetaldol, Hydroxybutyraldehyde, Betahydroxybutyraldehyde, Oxybutyricaldehyde, Oxybutanol)

$CH_3CH(OH)CH_2CHO$. M.W. 88.06. Colorless liq. Sp. gr. 1.1098. Flash point 181.4°C. F.P. below 0°C. B.P. 58°C. Miscible water, ether, alcohol. Uses—mfr. intermediates, organic chemicals, dyestuffs, perfumes; in engraving; ore flotation; in medicine; in mfr. of rubber antioxidants. Grades—tech.
White to dark brown solid with marked hydrophilic colloidal properties.

Griffin Chem Co, 1000 16 St, San Fran, Calif — Underhill 1-8610
†Niacet Chems Div, U S Vanadium Corp, 913 Niagara Bldg, Niagara Falls, N Y — Niagara Falls 2-2307

NOTE: Chemical Industries has compiled the best information obtainable from manufacturers concerning their products. However, no responsibility can be accepted for these claims.

ALGIN—see also Sodium and Ammonium Alginates

White to dark brown solid with marked hydrophilic colloidal properties.
Sol. in water; insol. in organic solvents. Properties of algin vary with source and method of mfr. pH 5-10; viscosity of 1% by wt. water solution, (10 to 4000 cps.) Moisture content, 5-20%; particle properties. Algin includes many of the properties of gelatin, tragacanth, karaya, acacia and locust bean gum, Irish Moss and agar-agar, and is used in lower concentrations. As colloidal stabilizer in ice cream, water ices, and other frozen desserts; suspending agent for cocoa fibers in chocolate milk; colloidal agent in various foodstuffs such as cakes, doughnuts, icings, salad dressings, and confectionery; sizing in textile industry; print pastes; leather finishing; paper coating; pharmaceuticals; cosmetics; waterproofing agent for concrete; boiler-water treatment; water paints; can-sealing compds; ceramics; creaming latex in rubber mfr; oil-well drilling muds. Grades: Refined (food grades) and technical (commercial grades).

ALUMINA ACTIVATED

Trade name product. A highly porous and granular form of aluminum oxide having preferential adsorptive capacity for moisture from gases, vapors and some liquids. It is available in granules ranging in size from a powder to pieces (1½ inches). Uses—drying gases and vapors, dehydrating cartridge in the liquid circuit of refrigerating systems, removal.

AMINES—see also Monoethanolamine, Diethanolamine, Triethanolamine, Ethylene Diamine, Acetoacetanilide, Monoamylamine, Diamylamine, etc.

A group of compounds derived from ammonia by substitution of organic radicals for hydrogen atoms. Class includes diamines (2 NH_2 groups), primary and tertiary amines, and quaternary bases, for both aliphatic and aromatic series. Amines used commercially include monoethanolamine, diethanolamine, ethylene, diamine, triethanolamine and acetoacetanilide. Uses—as bases; with fatty acids to form soaps; organic synthesis; removal CO_2 from inert gases; softening and moistening agents; acid gas absorbents; solvents, dispersing agents, plasticising agents; medicinals; rubber accelerators and inhibitors; dyestuff mfr.

ACIDS & AMMONIA

COMMERCIAL • C. P. REAGENT

ACETIC ACID, Glacial, Redistilled, Commercial and Treated Commercial and Reagent grades.

AMMONIA, Aqua, Commercial and Reagent, in a wide variety of grades and strengths.

BATTERY ACID, practically any sp. gr. between 1.200 and 1.835.

HYDROCHLORIC ACID, in Standard, Diamond, Crystal (low impurities) and Reagent grades.

HYDROFLUORIC ACID, Anhydrous and in 30, 48, 52, 60, 70 and 80% strengths, and Reagent grades.

MIXED ACID, varying proportions of Nitric and Sulfuric Acids to meet customers' requirements.

NITRIC ACID, Diamond Grade, practically water white and containing a minimum of impurities, in 36, 38, 40, 42, 43° Baume, 95%, and fuming grades. Photo-engravers' Grade offering special characteristics of value to the trade. Reagent grade noted for its uniform strength and freedom from more than the merest traces of impurities.

OLEUM, 10-65% free SO_3 content, higher on special order. Also oleums to which anti-freeze has been added.

OXALIC ACID, Commercial grade, crystals all thru 10 mesh containing a minimum 99.5% oxalic acid. Also reagent grade.

SULFURIC ACID, in Standard, Diamond and Reagent grades.

For laboratory and fine chemical manufacturing uses, B&A Quality Reagent A.C.S. Acids.

Offices in Principal Cities—See Office listing in our Directory ad.

AMMONIUM ALGINATE

A hydrophyllic vegetable colloid (ammonium salt of alginic acid) used in rubber manufacturing, can sealing compounds, etc.

Ducke, T M, & Sons, Inc, 117-119 Hudson St, N Y — Walker 5-5530
†Kelco Co, 31 Nassau St, N Y — Beekman 3-7367

AMMONIUM ALKYL PHOSPHATES

NH_4RHPO_4. Concentrated aqueous solutions of the ammonium salts of the monomethyl, ethyl, propyl, butyl, and amyl o-phosphates. Insoluble in alcohol. Find application as humectants and as fire-proofing compounds with the distinctive property that treated materials retain luster and flexibility. The butyl, and particularly the amyl, derivatives possess good penetrating ability.

American-British Chemical Supplies, Inc.

180 MADISON AVE. NEW YORK 16, N. Y.
CABLE ADDRESS: BISULPHIDE, N. Y.

★ ★ ★

Ammonium Bicarbonate	Ammonium Carbonate
Alkalies	Acetone
Fluorides	Butyl Alcohol
Gilsonite	Butyl Acetate
Hydrogen Peroxide	Carbon Tetrachloride
Lithopone	Casein
Sodium Bicarbonate	Citric Acid
Zinc Oxide	Cresol
Intermediates	Cresylic Acid
Plasticizers	Lactic Acid
Formaldehyde	Phenol
Hexamethylenetetramine	Pyridine
Phthalates	Triphenyl Phosphate
	Triacetin

Associated Companies:
(*Partial List*)
KAY-FRIES CHEMICALS, INC., NEW YORK
Chas. Tennant & Co., Ltd., Glasgow-Belfast-Dublin
Barter Trading Corp., Ltd., London
Chas. Tennant & Co. (Canada) Ltd., Toronto-Montreal

AMMONIUM CHROMATE

$(NH_4)_2CrO_4$. Yellow crystalline. Sp. gr. 1.846. M.P. 185°C. Sol. water. Insol. alcohol. Uses—mordant in dyeing textiles; sensitising photographic coatings. Grades—C.P.; tech.

†Baker, J T, Chem Co, Phillipsburg, N J — Phillipsburg, 5-2151
†Mineral Pigments Corp, Muirkirk, Md — Laurel 454

AMMONIUM CITRATE

$(NH_4)_2C_6H_6O_7$. White powd. or granules. Sp. gr. 1.479 (23°C.). Sol. water; slightly sol. alcohol. Uses—mfr. rust-proofing compositions, mordant in printing cottons; laboratory reagent. Keep from air.

†Baker, J T, Chem Co, Phillipsburg, N J — Phillipsburg, 5-2151
†Chemo Puro Mfg Corp, 26-32 Skillman Av, Long Is City, N Y — Stillwell 6-2330
Denver Fire Clay Co, 2301 Blake St, Denver, Colo — Tabor 0251
†Mallinckrodt Chem Wks, 2 & Mallinckrodt Sts, St Louis, Mo — Central 8980
†Pfizer,Chas, & Co Inc, 630 Flushing Av, Bklyn, N Y — Evergreen 8-3800
Republic Chem Corp, 94 Beekman St, N Y — Rector 2-9810

AMMONIUM ETHYL PHOSPHATE

75% soln. in water. Water-white to yellow tinge. Ammoniacal odor. Sp. gr. 1.23 at 25°C. pH 75% soln. 7.0-7.5. Viscosity at 25°C. 60 centipoises. Not stable to heat. When subjected to elevated temperature for any length of time as solution or while on any article will liberate ammonia with reduction in pH. Suggested use—as flame proofing agent for paper, textiles, etc.

★†Monsanto Chem Co, 1700 S 2 St, St Louis, Mo — Main 4000
†Victor Chem Wks, 141 W Jackson Blvd, Chicago, Ill — Harrison 7-3541

AMMONIUM FERROCYANIDE

$(NH_4)_4Fe(CN)_6.3H_2O$. M.W. 333.20. Greenish-yellowish crystals. Sol. water. Uses—as a reagent.

†Bower, Henry, Chem Mfg Co, Gray's Ferry Rd & 29 St, Phila, Pa — Howard 5-2100
†City Chem Corp, 132 W 22 St, N Y — Watkins 9-2723

AMMONIUM FLUOBORATE (Ammonium Borofluoride)

NH_4BF_4. M.W. 104.86. Hexagonal prisms. Sp. Gr. 1.831 at 17° C. Sol. water, alcohol. Packages as required.

†Baker & Adamson Prods, Gen Chem Div, Allied Chem & Dye Corp, 40 Rector St, N Y — Whitehall 4-2220
†Harshaw Chem Co, 1945 E 97 St, Cleveland, O — Cedar 1-6300

AMMONIUM FLUORIDE (Meat Salt)

NH_4F. White, deliq. crystalline. Sublimes. Sol. water; slightly sol. alcohol. Uses—mfr. fluorides, etching glass; as laboratory reagent, disinfectant and antiseptic in brewing; mordant in dyeing and printing, improving sandy soils. Caution—should be packed in rubber containers. Grades—tech.; C.P.; U.S.P. cryst.

†Baker & Adamson Prods, Gen Chem Div, Allied Chem & Dye Corp, 40 Rector St, N Y — Whitehall 4-2220
†Baker, J T, Chem Co, Phillipsburg, N J — Phillipsburg, 5-2151
†Hummel Chem Co, Inc, 90 West St, N Y — Rector 2-5687
Republic Chem Corp, 94 Beekman St, N Y — Rector 2-9810
†Sondheimer, Henry, Co, 103 Park Av, N Y — Murray Hill 5-4214

AMMONIUM FORMATE

NH_4CHO_2. Colorless, deliq. cryst. Sp. gr. 1.266. Decomposes on heating. Sol. water, alcohol. Uses—mfr. ammonium oxalate, formamide; condensing agent in making rayon; in medicine. Grades—commercial.

†Baker & Adamson Prods, Gen Chem Div, Allied Chem & Dye Corp, 40 Rector St, N Y — Whitehall 4-2220
†Baker, J T, Chem Co, Phillipsburg, N J — Phillipsburg, 5-2151
†Chemo Puro Mfg Corp, 26-32 Skillman Av, Long Is City, N Y — Stillwell 6-2330

AMMONIUM GLUCONATE

$NH_4C_6H_{11}O_7$. White powder. Uses—In foods as emulsifying agent for cheese and salad dressing.

†Chemo Puro Mfg Corp, 26-32 Skillman Av, Long Is City, N Y — Stillwell 6-2330
†Pfizer,Chas, & Co Inc, 630 Flushing Av, Bklyn, N Y — Evergreen 8-3800

AMMONIUM HYPOPHOSPHITE

$NH_4H_2PO_2$. Crystals or white powder. Uses—Medicinal.

†Chemo Puro Mfg Corp, 26-32 Skillman Av, Long Is City, N Y — Stillwell 6-2330
†N Y Quinine & Chem Wks Inc, 99-117 N 11 St, Bklyn, N Y — Evergreen 8-5600

AMMONIUM ICHTHYNATE

Brownish-black syrupy liquid. Burning taste. Uses—Medicinal.

†Chemo Puro Mfg Corp, 26-32 Skillman Av, Long Is City, N Y — Stillwell 6-2330
Fallek Products Co Inc, 163 Bway, N Y — Barclay 7-7939
†Heyden Chem Corp, 393 7 Av, N Y — Pennsylvania 6-9000
Huisking, Chas L, & Co, Inc, 155 Varick St, N Y — Algonquin 5-2900
†Mallinckrodt Chem Wks, 2 & Mallinckrodt Sts, St Louis, Mo — Central 8980

AMMONIUM ICHTHYOLSULFONATE—see Ichthyol

AMMONIUM IODIDE

NH_4I. M.W. 144.96. White cryst., hygroscopic or unstable powd. Sp. gr. 2.568. Sublimes on heating. Sol. water, alcohol. Uses—mfr. iodides; sensitive agent in making photographic films and plates; in medicine. Caution—store away from light. Grades—U.S.P.; C.P.; tech.

†Baker, J T, Chem Co, Phillipsburg, N J — Phillipsburg, 5-2151
†Chemo Puro Mfg Corp, 26-32 Skillman Av, Long Is City, N Y — Stillwell 6-2330
Denver Fire Clay Co, 2301 Blake St, Denver, Colo — Tabor 0251
†Mallinckrodt Chem Wks, 2 & Mallinckrodt Sts, St Louis, Mo — Central 8980
†Merck & Co Inc, 100 Lincoln Av, Rahway, N J — Rahway 7-1200
†N Y Quinine & Chem Wks Inc, 99-117 N 11 St, Bklyn, N Y — Evergreen 8-5600
†Pfizer,Chas, & Co Inc, 630 Flushing Av, Bklyn, N Y — Evergreen 8-3800

AMMONIUM LACTATE

$NH_4C_3H_5O_3$. Clear, colorless or slightly yellowish, syrupy liq. very hygroscopic. Sp. gr. 1.19—1.21 at 15°C. Miscible alcohol, water. Caution—keep cool, decomposes with heat. Uses—tanning and finishing leathers; electroplating baths. Grades—tech.

Ansenl Drug & Chem Co Inc, 117-119 E 24 St, N Y — Gramercy 3-3850
†City Chem Corp, 132 W 22 St, N Y — Watkins 9-2723
Kingston Chem Co, Inc, 15 William St, N Y — Whitehall 4-0007

AMMONIUM LINOLEATE

$NH_4C_{17}H_{31}CO_2$. Cream paste with ammoniacal odor. Uses—as detergent; emulsifying agent; reduces surface tension. Grades—tech.

†Harshaw Chem Co, 1945 E 97 St, Cleveland, O — Cedar 1-6300
†Stresen-Reuter, Fred'k A, Inc, 2113 Medill Av, Chicago, Ill — Humboldt 1552

Beier Co, N Y

AMMONIUM MOLYBDATE (Basic Molybdate)

$(NH_4)_6Mo_7O_{24} + 4H_2O$. Colorless or slightly greenish or yellowish cryst. Sp. gr. 2.85—2.95. M.P. decomposes on heating. Sol. water. Uses—mfr. pigments; laboratory reagent. Grades—C.P.; tech. solution.

†Baker, J T, Chem Co, Phillipsburg, N J — Phillipsburg, 5-2151
City Chem Corp, 132 W 22 St, N Y — Watkins 9-2723
Eimer & Amend, Greenwich & Morton Sts, N Y — Canal 6-4600
†Harshaw Chem Co, 1945 E 97 St, Cleveland, O — Cedar 1-6300
†Mallinckrodt Chem Wks, 2 & Mallinckrodt Sts, St Louis, Mo — Central 8980
Merck & Co Inc, 100 Lincoln Av, Rahway, N J — Rahway 7-1200
Millmaster Chem Co, 420 Lexington Av, N Y — Lexington 2-3959

†Climax Molybdenum Co, N Y — †Shattuck, S W, Chem Co, Denver, Colo
†North Metal & Chem Co, York, Pa

AMMONIUM NAPHTHENATE

Tan paste with ammoniacal odor. Uses—as a detergent; as an emulsifying agent.

†Harshaw Chem Co, 1945 E 97 St, Cleveland, O — Cedar 1-6300
†Stresen-Reuter, Fred'k A, Inc, 2113 Medill Av, Chicago, Ill — Humboldt 1552

AMMONIUM NITRATE

NH_4NO_3. M.W. 80.05. Colorless or white crystalline or granular powd. Sp. gr. 1.725. M.P. 169.6°C. Decomposes at 210°C. into water and nitrous oxide. Only sol. in water, alcohol, alkalies. Uses—mfr. laughing gas, military explosives, pyrotechnic compositions, insecticides, freezing mixtures, fertilizer; absorbent for nitrogen oxide. Grades—C.P.; tech.; cryst.; granulated.

AMMONIUM SULFATE

AMMONIUM NITRATE

AMMONIUM OLEATE (Ammonia Soap)

$NH_4C_{18}H_{33}O_2$. Yellow to brownish colored paste. Sol. alcohol, ether. Gives off strong ammonia odor. Uses—as a detergent; solidifying alcohol.

†Arnold, Hoffman & Co, Inc, 55 Canal St, Providence, R I — Gaspee 1-2935
†Harshaw Chem Co, 1945 E 97 St, Cleveland, O — Cedar 1-6300
†Stresen-Reuter, Fred'k A, Inc, 2113 Medill Av, Chicago, Ill — Humboldt 1552

AMMONIUM OXALATE

$(NH_4)_2C_2O_4 + H_2O$. Colorless crystalline. Sp. gr. 1.502. Decomposes on heating. Sol. water. Uses—mfr. oxalates, safety explosives; laboratory reagent. Grades—tech.; pure; C.P.

†Baker & Adamson Prods, Gen Chem Div, Allied Chem & Dye Corp, 40 Rector St, N Y — Whitehall 4-2220
†Baker, J T, Chem Co, Phillipsburg, N J — Phillipsburg, 5-2151

†Pfizer, Chas, & Co Inc, 630 Flushing Av, Bklyn, N Y — Evergreen 8-3800

AMMONIUM PERCHLORATE

$(NH_4)ClO_4$. White, solid crystalline. Dens. 1.95°C. Decomposes on heating. Sol. water. Uses—mfr. explosive compositions, pyrotechnics; etching and engraving agent; laboratory reagent. Grades—tech.; C.P.

†Baker, J T, Chem Co, Phillipsburg, N J — Phillipsburg, 5-2151
Barclay Chem Co, Inc, 75 Varick St, N Y — Worth 4-5120
International Selling Corp, 70 Pine St, N Y — Whitehall 4-7490
†Smith, G Frederick, Chem Co, 867 McKinley Av, Columbus, O — Adams 5343

AMMONIUM PERIODATE

†Smith, G Frederick, Chem Co, 867 McKinley Av, Columbus, O — Adams 5343

AMMONIUM PERSULFATE

$(NH_4)_2S_2O_8$. White, crystalline, granules or powd. Sp. gr. 1.982 Decomposes on heating. Sol. water. Uses—mfr. persulfates, aniline dyes; preserving food; fat and oil deodorant; oxidizing metals; electroplating metals; general bleaching and oxidizing agent; photographic reagent; bleaching soap oils; depolarizer in electric batteries; washing infected yeast; in medicine. Grades—tech.; pure; C.P.

†Baker, J T, Chem Co, Phillipsburg, N J — Phillipsburg, 5-2151
Denver Fire Clay Co, 2301 Blake St, Denver, Colo — Tabor 0251
Eimer & Amend, Greenwich & Morton Sts, N Y — Canal 6-4600

AMMONIUM SULFATE

$(NH_4)_2SO_4$. M.W. 115.11. Brownish gray to white cryst. Sp. gr. 1.7687. M.P. 513°C., d. Decomposes before it melts to certain extent. Complete decomposition at 300°C. Sol. water. Uses—mfr. candles, ammonia, electric batteries; fireproofing textiles, wood, etc.; fertilizer; soldering and galvanizing agent. Grades—C.P.; commercial.

Amer Cyanamid Co, Industrial Chems Div, 30 Rockefeller Plaza, N Y	Circle 7-0100
†Baker & Adamson Prods, Gen Chem Div, Allied Chem & Dye Corp, 40 Rector St, N Y	Whitehall 4-2220

DAVISON *Silicofluorides*

AMMONIUM SILICOFLUORIDE $(NH_4)_2\ SiF_6$

Technical grade, white, water soluble, fine crystal, minimum 98% $(NH_4)_2\ SiF_6$; inert ingredients not over 2%.

Uses: Laundry sour; disinfectant; magnesium sand casting; glass etching; chemical reagent.

MAGNESIUM SILICOFLUORIDE $(Mg\ SiF_6 \cdot 6H_2O)$

Technical grade, white granular crystal; minimum 98% $MgSiF_6 \cdot 6H_2O$; inert ingredients not over 2%.

Uses: principally as concrete hardener, waterproofer and primer preparatory to painting; in ceramic industry.

ZINC SILICOFLUORIDE $(Zn\ SiF_6 \cdot 6H_2O)$

Technical grade, white granular crystal; minimum 97% $ZnSiF_6 \cdot 6H_2O$; inert ingredients not over 3%.

Uses: Concrete hardener when used in combination with magnesium silicofluoride; laundry sour; wood preservation and mothproofing agent.

CASTING COMPOUND

Casting Compound 23-A is used in the magnesium casting industry. Prevents easily oxidizable metals such as magnesium and magnesium alloys from oxidizing or burning in green sand molds. Used as a flux in melting and pouring magnesium alloys.

POTASSIUM SILICOFLUORIDE

Technical grade; white, odorless fine crystalline powder minimum 97% K_2SiF_6; inert ingredients not over 3%.

Uses: metallurgy of aluminum, in manufacture of porcelain enamel, opalescent glass, artificial marble, as an insecticide, as a chemical intermediate.

★

Shipment in 100 and 400 lb. containers by rail, truck, or water.

Many other uses than those listed are possible. Requests for small quantities for experimental purposes will be given prompt attention. Ask our Technical Service Department for assistance.

AMYL NAPHTHALENES (Mixed)

Refined: Yellow to brown viscous oily liq. Sp. gr. at 20°C. 0.94-0.98. Distillation—initial B.P. not below 288°C.; 95% distils below 362°C.; final B.P. not above 367°C. Weight per gal. 7.90 lbs. A distilled mixture of monoamyl and diamyl naphthalenes, each containing the amyl group in its isomeric forms; are alkylated aromatic hydrocarbons not affected under ordinary conditions by water or dilute acids or alkalies. Uses—high-boiling solvent and plasticizer for synthetic resins and asphaltic materials; in manufacturing of certain types of inks and vitrifiable colors; as a medium for constant temperature baths; coupling agent for certain vegetable and mineral oils; in manufacturing of chemicals for the textile industry.

†Sharples Chems Inc, Phila, Pa Kingsley 5-2802

AMYL OLEATE

$C_{17}H_{33}COOC_5H_{11}$. M.W. 352.34. Sp. gr. 0.862. Boiling range 253-272°C. M.P. 6.0°C. Water-white, faint fruity odor.

†Kessler Chem Co, Inc, State Rd & Cottman Av, Phila, Pa Devonshire 8-0800
†Nopco Chem Co, Logan & Davis Sts, Harrison, N J Harrison 6-6200

AMYL PHENOL

†Sharples Chems Inc, Phila, Pa Kingsley 5-2802

o-AMYL PHENOL

$C_5H_{11}C_6H_4OH$. M.W. 164.12. Color—pale yellow. Sp. gr. at 30°C. 0.96-0.97. Distillation—initial boiling point not below 233°C., final boiling point not above 245°C. Flash point 219°F. Wt. per gal 8.12 lbs. Uses—anti-skinning agent for paints, varnishes and oleoresinous enamels.

†Sharples Chems Inc, Phila, Pa Kingsley 5-2802

PENTAPHEN
P-TERT-AMYLPHENOL
Sharples Chemicals Inc. PHILADELPHIA - CHICAGO - NEW YORK

p-AMYL PHENOL, Secondary

$C_5H_{11}C_6H_4OH$. M.W. 164.2. Light straw solid. Uses: organic synthesis.

†Sharples Chems Inc, Phila, Pa Kingsley 5-2802

p-Tertiary-AMYL PHENOL

$C_5H_{11}C_6H_4OH$. Sp. gr. 0.91-0.94 (95°C.). M.W. 164. Softening Point not less than 80°C. Final Melting Point not less than 88°C. Distillation 90% bet. 250-265°C. Solubility—sol. 10% aqueous KOH. F.P. 256°F. Insol. water; readily sol. most organic solvents. Impurities—non-volatile matter, not over 0.001%. Free phenol, less than 0.1%. Very small amounts of amyl phenyl ethers and secondary amyl phenol. Uses—mfr. oil soluble varnish resins of phenol-formaldehyde type.

†Sharples Chems Inc, Phila, Pa Kingsley 5-2802

AMYL PHOSPHATE

C_5H_{11}. H_3PO_4. Syrupy liquid. Uses—solvent, plasticizer.

★†Monsanto Chem Co, 1700 S 2 St, St Louis, Mo Main 4000
†Victor Chem Wks, 141 W Jackson Blvd, Chicago, Ill Harrison 7-3541

AMYL PROPIONATE

$CH_3.CH_2CO_2C_5H_{11}$. Water-white liq. Sp. gr. 0.863-0.866 at 20°/20°C. Wght. per gal., 7.19 lbs. at 20°C. B.P. 160°C. Uses—solvent for nitrocellulose where high-boiling solvent is desirable; in brushing lacquers.

Dodge & Olcott, Inc, 180 Varick St, N Y Watkins 4-3600

ANODES, METALS & ALLOYS (misc.)

Gold: Alloys of gold, silver, copper, nickel, zinc, etc., from 10 to 18 karat in white, red and yellow, are suitable for use as gold anodes in gold electroplating solutions. However, pure or 24 karat gold can also be used. Silver: Pure and alloys of silver are used in silver electroplating solutions. Various: Pure and alloys of the following are also used as anodes in various electroplating solutions for high class jewelry. Platinum—Palladium—Tungsten—usually alloyed with gold and silver.

†Belmont Smelting & Refg Wks Inc, 322 Belmont Av, Bklyn, N Y	Dickens 2-4900
Chem Service Corp, 92A Beaver St, N Y	Hanover 2-6970
Kruger, L, & Co, Inc, N Y	†Metals Refg Co, Hammond, Ind

ANODES, NICKEL

Extremely pure nickel fashioned in various shapes with a hook or other means of suspension in the electroplating solution. Should possess good grain structure so that it will corrode evenly, feed the solution with a minimum loss of metal; should release a minimum amount of sludge.

Amer Firstoline Corp, 420 Lexington Av, N Y	Murray Hill 3-3201
†Belmont Smelting & Refg Wks Inc, 322 Belmont Av, Bklyn, N Y	Dickens 2-4900

ASBESTOS
FIBER and PRODUCTS

BECAUSE of their resistance to the corrosive action of acid fumes, vapors and gases, asbestos fiber and asbestos products have a wide range of applications in the chemical industry.

Johns-Manville produces all grades and lengths of asbestos fiber, each representing the highest value in its class and the utmost uniformity in grading and volume. Johns-Manville asbestos products include:

- Insulations
- Transite Movable Partitions
- Brake Linings
- Clutch Facings
- Chemstone Panels (for table tops, fume hoods, etc.)
- Roofing and Siding
- Transite Industrial Vent Pipe
- Packings and Gaskets
- Transite Water and Sewer Pipe
- Flexboard
- Flooring

BALSAM, PERUVIAN (Indian Balsam, China Oil, Black Balsam)

From Toluifera Pereirae (Royle) Boll. Comes from Central America (San Salvador) in forests near Pacific Coast. Composed of 60-66% cinnamein—esters of cinnamic and benzoic acid; about 28% styracine vanillin. Dark brown, viscid liquid, pleasant aromatic odor; warm, bitter taste. Sp. Jr.—1.150-1.170. Insol.—water, olive oil; sol.—alcohol, chloroform, glacial acetic acid. Uses—Medicine, Perfumery, Chocolate Manuf., also, making of odors.

BARIUM CARBONATE (Witherite)

$BaCO_3$. White powd. Natural and manufactured. (The natural mineral called Witherite contains higher percentage of impurities than precipitated $BaCO_3$ and has a grayish white or yellowish color.) Sol. acids. Uses—mfr. barium salts, dyes, pyrotechnics, optical glass, rat poisons, flat wall paints, cosmetics, beet sugar, tile, terra-cotta, porcelains, pot'eries; laboratory reagent; in steel and metal industry; to prevent scum and efflorescence in bricks, tile, sewer pipe, etc.; filler; paper, linoleum, rubber and soap filler; water purifier. Poisonous. Grades—natural (witherite); precipitated; C.P.; tech.

†Smith, G Frederick, Chem Co, 867 McKinley Av, Columbus, O — Adams 5343

BARIUM PERMANGANATE

$Ba(MnO_4)_2$. M.W. 375.3. Brownish violet crystals; sol. water. Uses—mfr. permanganates, pure permanganic acid; in research. It is more active and less stable than potassium permanganate.

†Eimer & Amend, Greenwich & Morton Sts, N Y — Canal 6-4600

BARIUM PEROXIDE (Barium Binoxide, Barium Dioxide)

BaO_2. Grayish-white powd. Cryst. have formula $BaO_2.8H_2O$. Sp. gr. 4.958. M.P. 450°C. Sol. dilute alcohol, acids. Decomposes in water. Uses—mfr. barium salts, oxygen, in Brin's Process for hydrogen peroxide, green light, oxygenated water; primer in alumio-thermic welding; general bleaching agent; bleaching textiles mordant in dyeing and printing fabrics. Grades—88-90%; tech.; C.P.

BARIUM SULFIDE

CHEMICAL PRODUCTS CORPORATION

CARTERSVILLE, GEORGIA

BARIUM SULFIDE (Barium Monosulfide)

BaS. Grayish-white powd., technical—brownish-black powd. in lumps. Sp. gr. 4.25 (15°C.). Infusible. Decomposes in water. Uses—mfr. barium salts, hydrogen sulfide gas, luminous paints; for producing rich shades of brown coloring on copper; vulcanising rubber; weighting gutta percha; laboratory reagent; as depilatory. Grades—tech.; C.P.

†Baker, J T, Chem Co, Phillipsburg, N J — Phillipsburg, 5-2151

BAUXITE (Bauxite)

$Al_2O(OH)_4$. White to deep red amorp. Natural. Sp. gr. 2.4 to 2.5. Insol. water. Decomposed by HCl. Uses—mfr. corundum, artificial emery, abrasive papers and cloths, alum, alum cake, alumina,

POROCEL Hard, highly adsorbent, large-surface-area activated bauxites utilizing either foreign or domestic ores. Supplied in various standard meshes, moisture contents, and in regular, low iron or low silica grades.

Recommended generally as an adsorbent, catalyst and catalyst carrier. Used widely as a lubricating oil and wax percolating medium, vapor phase desulphurization catalyst, aluminum chloride catalyst support and trap, refining medium for sugar liquors, and as an agent for the removal of fluoride contaminants from hydrocarbon streams.

BENTONITE (Colloidal Clay)

Clay-like mineral of varying color and properties. Uses—Foundry molding sand rejuvenator; oil-well drilling mud thickener and suspending agent; for stopping water seepage in dams, reservoirs and mines; clarification of drinking water supplies; purification of sewage and disposal wastes; laundry detergent and ingredient of soap and cleaning and polishing compounds; suspending and adhesive agents in insecticides; bond for refractory and acoustics insulation; ceramic bond; emulsifier for latex, asphalt and other water immiscible substances, wine clarifier; as a thickening paste-forming and suspending ingredient in pharmaceuticals and cosmetics; petroleum, animal, and vegetable oil refining in natural and activated forms.

BUTYL ACETOACETATE

★†Carbide & Carbon Chems Div, Union Carbide & Carbon Corp, 30 E 42 St, N Y — Murray Hill 7-8000

n-butyl acetate

• Eastman n-butyl acetate is a completely synthetic material whose preparation is subject to rigid control resulting in an exceptionally pure product. It is one of the most commonly used medium-evaporating solvents used in the lacquer trade and also is employed as an extracting solvent in the artificial leather, flavoring, perfume and other industries. Available in drums, compartmented and full tank cars.

BUTYL ACID PYROPHOSPHATE

†Victor Chem Wks, 141 W Jackson Blvd, Chicago, Ill — Harrison 7-3541

n-BUTYL AMINE

$CH_3CH_2CH_2CH_2NH_2$. Sp. gr. at 20/20°C., 0.7385; B. P. 77.01°C.; completely miscible with water; lb. per gal. at 20°C., 6.15. Has a characteristic ammoniacal odor, and with fatty acids forms soaps which show unusually high degree of solubility in hydrocarbons. It combines readily with acids, aldehydes, olefin oxides, chlorhydrins, and organic sulfur compounds, and is useful intermediate in making emulsifying agents, dyestuffs, rubber chemicals, flotation agents, corrosion inhibitors, and insecticides.

BUTYLUREA

$NH_2CONHC_4H_9$. M.W. 116. Insol. methanol. Color, white. Uses: surface coatings and adhesives.

Robert & Co, Inc, 60 Broad St, N Y Digby 4-4870
†Sharples Chems Inc, Phila, Pa Kingsley 5-2802

2-3-BUTYLENE GLYCOL (Butanediol)

$CH_3\text{-}CHOH\text{-}CHOH\text{-}CH_3$. M.W. 90.08. Nearly colorless sol. or liq., hygroscopic. Sp. gr. 1.000 (25°C.). B.P. 184°C. M.P. 24°C.-27°C. Miscible with water in all proportions. Refract. index 1.438 (20°C.). Uses—solvent for dyes, has good penetration into wood and textiles, is resistant against alkali, non-resistant against most mineral acids. Forms nitrates with nitric. Forms resins with phthalic anhydride. Grades—90% 2-3 butylene glycol.

★†Carbide & Carbon Chems Div, Union Carbide & Carbon Corp, 30 E 42 St, N Y Murray Hill 7-8000

3-BUTYN-1-OL (beta-Ethynyl Ethanol)

$HC{\equiv}CCH_2CH_2OH$. M.W. 70.09. Colorless liquid; characteristic odor. Uses: organic syntheses, pharmaceuticals, plastics.

†Farchan Research Labs, 609 E 127 St, Cleveland, O Glenville 1-8749

3-BUTYN-2-OL (Methyl Ethynyl Carbinol)

$HC{\equiv}C{\cdot}C(OH)CH_3$. M.W. 70.1. Colorless liquid; characteristic odor. Uses: organic synthesis, pharmaceuticals, plastics.

†Farchan Research Labs, 609 E 127 St, Cleveland, O — Glenville 1-8749

n-BUTYRALDEHYDE

C_4H_8O. M.W. 72.10. Colorless liquid. B.P. 75.7°C. Slightly sol. in water; very sol. in organic solvents.

CAFFEINE (1,3,7-trimethylxanthine, theine)

$C_8H_{10}N_4O_2{\cdot}H_2O$. M.W. 194.11. White need. from alcohol. M.P. 235-237°C. Sol. water, alcohol. Uses—medicine and beverage. Grades—U.S.P., anhydrous crystalline loss on drying at 80°C., 6.5% max. on anhydrous—25% max.

CAFFEINE, U.S.P.
Standard Forms: Anhydrous powder or hydrated flakes.
Specifications: White powder—loss on drying at 80° C.; anhydrous powder 0.25% max.; hydrated flakes, 5.75-6.50%; m.p. 236.0° C. min.; meets U.S.P. test for carbonizable impurities.

Witco WITCARBS

Untreated precipitated calcium carbonate.

WITCARB R—the most finely divided reinforcing white filler in rubber, extender of Titanium Dioxide in paints.

WITCARB Regular—prepared especially for use in paints and giving exceptional results.

WITCARB R-12 is an economical inert filler for use in both natural and manufactured rubbers.

CALCIUM CHLORIDE

JOHN A. CHEW
Incorporated
INDUSTRIAL AND FINE CHEMICALS
60 East 42nd Street, New York 17, N. Y. MU 2-0993

CALCIUM CHLORIDE

$CaCl_2H_2O$. White, deliq. crystalline or amorp. Tech. article is either solid or flake or in solution. Sp. gr. 2.152 (20°C.) and 1.684 resp. M.P. 774°C. and 29.48°C. resp. B.P. (for salt +2H₂O) 128-130°C. Sol. water, alcohol. Uses—mfr. tartaric acid ammonium chloride, precipitated chalk, chemical salts, intermediate and organic chemicals, gun-powder, mineral waters, starches, paper size, dry colors, fireproof paints, metallic calcium; drying agent for gases; food preservative; refrigerating and anti-freezing solutions; cooling solutions in ice plants; textile size and finishing cotton fabrics; purifying water; disinfectant; dehydrating petroleum; preserving wood; laboratory reagent; anti-freezing solutions in automobile radiators; dust layer for roads; fire protection; weed killer; preventing explosions in collieries and in washing coal; tempering metals; drying fruits and vegetables before canning; in medicine. Grades—C.P.; U.S.P.; tech.; liq.; flaked; granulated; powdered; solid—73-75%.

CALCIUM LACTATE

Available in U.S.P. and Edible Grades.
A more economical, more soluble, more concentrated form of organic calcium.
Valuable in calcium nutrition and therapy.
Useful as a base chemical.

SHEFFIELD FARMS COMPANY, INC.
CHEMURGIC DIVISION
Main Office: Norwich, N. Y. Branch Sales Office: 524 W. 57th St., New York 19, N. Y.
Div. of National Dairy Products Corp.

CALCIUM LACTATE

Contains not less than 70% and not more than 75% of Ca $(C_3H_5O_3)_2$ corresponding to not less than 98% of the hydrated salt $(Ca(C_3H_5O_3)_2 3H_2O)$. White granular masses or powder. Odorless usually; efflorescent; becomes anhydrous at 120°C. Grades—U.S.P. and edible. Uses—mfr. foods, beverages.

CARBOXYMETHYL CELLULOSE (Sodium Carboxymethyl Cellulose, Sodium Cellulose Glycolate)

White to cream colored finely ground powder. Uses: detergency promoter; paper finish for resistance to grease and ink; warp size and finishing material; emulsifying agent; adhesive and binder in ceramics.

HERCULES

HERCULES* CMC

Water-soluble cellulose gum (sodium carboxymethylcellulose). Available in varying viscosity types in Purified and Technical Grades.

CARBOSE*
(Sodium Carboxymethyl Cellulose)

Wyandotte Carbose is designed specifically for detergent applications and a wide variety of other industrial uses requiring a low viscosity, rapidly soluble material.

In addition to its use in conjunction with soaps and synthetic detergents to effect a marked increase in carbon soil removal and whiteness retention on cottons, Carbose is extremely useful for improving the bursting strength of test liner as well as for giving various types of paper and paper board a superior finish which is resistant to penetration by inks and grease.

Carbose is of value as a warp size and finishing material in the textile industry.

Other applications include its use as a protective colloid, as an emulsifying agent and as an adhesive and binder.

*Reg. U. S. Pat. Off.

Samples and data available upon request.

CHARCOAL (Wood Charcoal, Vegetable Charcoal—see also Bone Black)

Black, amorp. solid. Sp. gr. 1.75-2.10. Sublimes at 3600°C. Insol. all common solvents, acids, alkalies. Uses—mfr. calcium carbide, charcoal iron, military gas masks, arc light electrodes, crayons, heating insulating compositions, paint colors, candle wicks; pigment colors, paints, glass, black powd., nitroglycerin and nitrocellulose explosives; chemical catalyst; general decolorizing and filtering medium in chemical processes; precipitant in chemical processes; volatile solvent absorbent; gas absorbent in cold storage, absorbent gas, casing-head gasoline and perfume products; decolorizing and deodorizing fats and oils; purifying water and deodorizing sewage; deodorant in breweries; case-hardening steel; fuel in forges; soil disinfectant; laboratory reagent; in refining alcohol and sugar; horticulture; poultry farming. Grades—Wood (willow, oak, pine, etc.) sticks; lump; powdered; tech.; U.S.P.; animal (bone black); powdered.

Chemical Industries

Always at their fingertips, CHEMICAL INDUSTRIES is a dependable source of information. New Chemicals, new uses, chemical reports and trends are but a few of the topics authoritatively discussed.

Every executive in the chemical industry will profit by a personal subscription. Prices are $5.00 a year; $8.00 for two years.

CHARCOAL (Activated)

Form of carbon having a high adsorptive capacity for foreign molecules. Extent of adsorptive power depends upon size of capillaries of the charcoal and the size and chemical properties of the molecules to be adsorbed. Den.—when free from impurities is about 2.1. Chemical composition varies with source, may range from 10%-98% carbon. Uses—air purification by removal of gases; decolorizing; catalysts; gas-mask-canister filling; production of high vacuum; medical remedy for colic and diarrhea; as germicide; solvent recovery; gasoline recovery from natural gas; benzene recovery from manufactured gas.

CHEMICALS ANALYTICAL

Chemicals of high degree of purity used in research and control laboratories and usually sold under the following descriptive terms: Reagent, A.C.S., and Reagent grades denoting highest grade available, the former assuring conformity with American Chemical Society Standards, the latter generally applying to chemicals for which the A.C.S. has not made specifications and indicates a comparable grade of purity; C.P. Suitable for routine work in industrial and educational institutions, conforming to analysis on label: U.S.P. and N.F. grades indicating conformity to the requirements of the United

Comprehensive Stocks • Modern Facilities

Eimer and Amend is first source of supply for laboratory chemicals. E. & A. Tested Purity Reagents meet A.C.S. specifications and the exact analysis is stated on the label.

Eimer and Amend maintains most comprehensive stocks of various chemicals and reagents from which laboratories can draw their entire needs—these are on hand for prompt shipment along with chemical apparatus and other laboratory requirements.

Following are the classifications of E. & A.'s chemical stocks:

Tested Purity Reagents	Alloys	H-Ion Indicators	Stains
USP Chemicals	Anilines	Metals	Starches
Pure and Purified Chemicals	Biological Stains	Oils	Sugars
Technical Chemicals	Buffer Solutions	Powders	Test Papers
Organic Chemicals	Dyes	Resins	Tinctures
Micro Chemicals	Extracts	Solutions	Waxes
	Gums	Spirits	

There are 9,576 listings in E. & A's chemical catalog "Laboratory Chemicals", sent free on request to laboratories.

Modern Fragrances

FOR YOUR PRODUCTS

COME TO VERONA...if you are seeking the *new* or the *exceptional* in fragrances for your Perfumes or Cosmetics...or Cover Odors for industrial products.

Through our *ceaseless research in aromatics*, many new products are being developed and old processes improved.

Through our highly skilled technical staff and outstanding plant facilities, your *individual* requirements can be met to *your satisfaction*.

VERONA SPECIALTIES INCLUDE:

CYCLAMAL — FLORANOL
AMUSKAL — IONONES
ACETALS — and many others

VERONA — Complete list on request. Write

CHLOROACETAMIDE

†Dow Chem Co, Midland, Mich — Midland 500

o-CHLORO-ACETOACETANILIDE

$CH_3COCH_2CONHC_6H_4Cl$. M.W. 211.65. White, crystalline solid. M.P. 107°C. Insol. in water. Uses—mfr. azo dyes, including Hansa colors; intermediate in organic synthesis.

★†Carbide & Carbon Chems Div, Union Carbide & Carbon Corp, 30 E 42 St, N Y — Murray Hill 7-8000

CHLOROACETONE

CH_3COCH_2Cl. Chloroacetone contains an active ketone group and an extremely reactive chlorine atom. It finds application in the synthesis of many products such as pharmaceuticals, dyes, and other organic compounds. For example, Chloroacetone reacts readily with amines to form acetonyl-amines, with glycols to form chlorodioxolanes, with mercaptans to form sulfides or sulfur ethers, and with potassium formate to form acetol. Its purity is 85% to 90%, the remainder consisting almost entirely of unsymmetrical dichloroacetone. Chloroacetone is a very powerful lachrymator and will blister the skin on contact. Adequate precautions should therefore be taken in handling this product. Properties: Boiling point, 119°C. at 760 mm. of mercury (pure material). Flash point, 42.2°C. (108°F.). Sp. gr., 1.165 at 20°C./20°C. Weight per U.S. gallon, 9.69 lbs. at 68°F. Refractive index, 1.4324 at 20°C. Coefficient of cubical expansion, 0.00110 per °C., 0.00061 per °F. Odor, strong, irritating (lachrymatory).

†Distillation Prods Industries Div, Eastman Kodak Co, Rochester, N Y — Glenwood 1877

CHLOROACETOPHENONE (Phenacyl Chloride)

$C_6H_5COCH_2Cl$. M.W. 154.51. M.P. 59° C. Moisture less than 0.2%. Light brown crystalline solid. Uses—tear gas in cartridges, grenades and candles. Effective in concentrations as low as one part in three million of air. Grades—tech.

†Dow Chem Co, Midland, Mich — Midland 500

CHLOROACETYL CHLORIDE

$CH_2ClCOCl$. M.W. 112.9. Clear, colorless liquid with sharp odor. Very irritating to eyes and mucous membranes. Sp. gr. 1.495 at 0/4°. Weight per gal. 12.5 lbs. at 0°C. B.P. 105.0 to 106.0°C. Decomposes in water and alcohol. Uses—mfr. chloracetophenone; in organic syntheses.

†Dow Chem Co, Midland, Mich — Midland 500

m-CHLOROANILINE

C_6H_6NCl. M.W. 127.5. Clear, light yellow liquid. Dist. Range, 228.0°-231.0°C. Dry point (95% within 1.0°C.). Cryst. point, approx. —10°C. Weight per gal. 10 lbs. Uses: mfr. dyestuffs, pigments. Metachloraniline finds application both direct, and when diazotized, as fast orange bases and salts. Used as an intermediate in the preparation of Anthosin Violet and Azo Brilliant Reds, Permanent Orange R. and Helio Orange GL. Ship. Reg.—Poison (label required). Ship. Classification—dye intermediate.

†Hilton-Davis Chem Co Div, 2235 Langdon Farm Rd, Cincinnati, O — Elmhurst 1300
★†Monsanto Chem Co, 1700 S 2 St, St Louis, Mo — Main 4000

o-CHLOROANILINE

C_6H_6NCl. M.W. 127.54. Light amber-colored liquid. Crystallizing point -4.5°C. minimum. Sol. dilute HCl. Distillation range 206.5°C. to 211.5°C. (96% within 3°C.). Weight per gal. 10 lbs., approx. Uses—intermediate for dyes.

†Hilton-Davis Chem Co Div, 2235 Langdon Farm Rd, Cincinnati, O — Elmhurst 1300

CHLOROCRESOL (Chlormetacresol)

$C_6H_3CH_3.OH.Cl$. White crystalline powd. B.P. 236°C. Sol. alcohol, benzene, chloroform. Uses—mfr. oxymonoazo dyes, parachlormetacresol dyes; preservative glue pastes and inks; disinfectant.

†Barrett Div, Allied Chem & Dye Corp, 40 Rector St, N Y — Whitehall 4-0800
Coaltar Chems Corp, 420 Lexington Av, N Y — Oregon 9-2550

CHLORO-m-CRESOL (Chloroxymethylbenzene)

$C_6H_3CH_3.OH.Cl$. White crystalline powd., cresol odor. B.P. 236°C. Sol. alcohol, benzene, chloroform. Uses—mfr. oxymonoazo dyes, parachlormetacresol $CH_3C_6H_2Cl.[4].HO$ dyes; preservative glue pastes and inks; as disinfectant.

†Barrett Div, Allied Chem & Dye Corp, 40 Rector St, N Y — Whitehall 4-0800

p-CHLORO-m-CRESOL

C_7H_7OCl. M.W. 142.53. Colorless crystals, phenolic odor. Sol. organic solvents. Insol. water. M.P. 46° C. B.P. 196° C. Use—antiseptic preparations.

†Barrett Div, Allied Chem & Dye Corp, 40 Rector St, N Y — Whitehall 4-0800
★†Monsanto Chem Co, 1700 S 2 St, St Louis, Mo — Main 4000

2-CHLOROCYCLOHEXANONE

$C_6H_9O(Cl)$. M.W. 131.50. Colorless liquid; sharp odor. Uses: organic syntheses, insecticides

†Farchan Research Labs, 609 E 127 St, Cleveland, O — Glenville 1-8749

1-CHLORO-2,2-DIFLUOROPROPANE

†Halogen Chems, Inc, 616 King St, Columbia, S C — 7125

1-CHLORO-1-NITROETHANE

CH_3CHNO_2Cl. M.W. 109.52. Uses: solvent for fats and waxes; antigelling agent for rubber cement.

†Commercial Solvents Corp, 17 E 42 St, N Y — Vanderbilt 6-1600

1-CHLORO-1-NITROPROPANE

$CH_3CH_2CHNO_2Cl$. M.W. 123.54. Miscible with most organic solvents. Uses: solvent for fats and waxes; anti-gelling agent for rubber cement.

†Commercial Solvents Corp, 17 E 42 St, N Y — Vanderbilt 6-1600

2-CHLORO-2-NITROPROPANE

$CH_3CNO_2ClCH_3$. M.W. 123.54. Miscible with most organic solvents. Uses: solvents for fats and waxes; anti-gelling for rubber cement.

†Commercial Solvents Corp, 17 E 42 St, N Y — Vanderbilt 6-1600

p-CHLORO-o-NITROPHENOL

†Verona Chem Co, 26 Verona Av, Newark, N J — Humboldt 3-3209

o-CHLORO PHENOL

C_6H_5OCl. M.W. 128.53. Yellow or brown liq. Dist. limits 173.0° to 177.0°C. Sp. gr. 1.265 at 15.5°C. Weight per gal., 10.5 lbs. approx. Uses—mfr. alizarines, pyrocatechol, in organic synthesis. Ship. Class.—dye intermediate. Ship. reg.—Poison (label required).

†Dow Chem Co, Midland, Mich	Midland 500
★†Monsanto Chem Co, 1700 S 2 St, St Louis, Mo	Main 4000

p-CHLOROPHENOL

C_6H_5OCl. M.W. 128.53. Weight per gal., 11 lbs. approx. Distillation limits 218.0° to 220°C. Distillation range 4°C. maximum. Yellowish light brown crystalline mass, unpleasant penetrating odor. Sp. gr. 1.306. M.P. 37°C. B.P. 217°C. Sol. alcohol, ether; very slightly sol. water. Uses—mfr. dyestuffs, intermediates, hydroquinone, pharmaceutical derivatives.

†Dow Chem Co, Midland, Mich	Midland 500
★†Monsanto Chem Co, 1700 S 2 St, St Louis, Mo	Main 4000

CHLOROPHENOL BLUE (Tetrachlorophenol Sulfonphthalein)

$C_{19}H_{10}Cl_4O_5S$. M.W. 492. Light yellow crystalline powder. Uses: pH indicator - pH range 3.0 (yellow) to 4.6 (blue).

†Hartman-Leddon Co, Inc, 5821 Market St, Phila, Pa — Allegheny 4-8832

CHLOROPHENOL RED (Dichlorphenolsulfonphthalein)

$C_{19}H_{12}Cl_2O_5S$. M.W. 423.2. Fine, green or greenish brown crystals. Uses: pH indicator - pH range 5.2 (yellow) to 6.8 (red).

†Distillation Prods Industries Div, Eastman Kodak Co, Rochester, N Y	Glenwood 1877
†Hartman-Leddon Co, Inc, 5821 Market St, Phila, Pa	Allegheny 4-8832

6-CHLORO-2-PHENYLPHENOL

†Dow Chem Co, Midland, Mich — Midland 500

2-CHLORO-4-PHENYLPHENOL

$C_6H_3.C_6H_3ClOH$. M.W. 204.5. Light-colored crystalline solid. B.P. at 7mm. 160-163°C. M.P. above 77.0°C. Sol. sodium hydroxide solutions and most organic solvents; insol. in water.

†Dow Chem Co, Midland, Mich — Midland 500

2-CHLORO-6-PHENYLPHENOL

$C_6H_3.C_6H_3ClOH$. M.W. 204.5. Colorless to light straw-colored, viscous liquid with a slight characteristic odor; tech. grade deposits crystals on standing at 15°C. B.P. 315-317°C., with slight decomposition. Sp. gr. 1.24 at 24/4°C. Weight per gal. 10.6 lbs. at 77°F. M.P. 6.0°C. Refractive index at 30°C. 1.6237-1.6287. Sol. in sodium hydroxide solutions and most organic solvents; insol. water. Uses—as a germicide and fungicide. Grades—tech.; purified.

†Dow Chem Co, Midland, Mich — Midland 500

CHLOROPHYLL (Leaf-Green)

$C_{55}H_{72}O_7N_4Mg$. Green, solid, crystalline. Natural. No. M.P. Decomposes on heating. Sol. alcohol; very slightly sol. ether. Uses—coloring foods, stearin candles, leather, perfumes, cosmetics, vaseline, soap and wax. Grades—oil sol. water sol.

CHROMIUM CARBONATE

†Baker, J T, Chem Co, Phillipsburg, N J — Phillipsburg, 5-2151
Doggett, Stanley, Inc, 75 Varick St, N Y — Walker 5-1051

CHROMIUM CHLORIDE (Chromic Chloride, Chromium Sesquichloride)

$CrCl_3$. Greenish, crystalline powd. Sp. gr. 2.757 (15°C.). B.P. 1200-1500°C. Slightly sol. hot water, sol. water in presence of trace chromous chloride. Sublimes to form chromium sesquichloride. Used as a catalyzer. Uses—mfr. chromium salts; catalyst in making intermediates and organic chemicals; mordant in dyeing and printing textiles; finishing leather; electroplating chromium. Grades—tech.; C.P.

CLAYS, ACTIVATED

Acid-treated clays, usually bentonite whose bleaching action has been considerably increased by the action of the acid. Generally used in form of fine powder.

★

ATTACLAY A highly efficient carrier, diluent, extender, and conditioner used in the manufacture of insecticide concentrates, finished dusts, fungicides, wettable powders, rodenticides, herbicides, plant hormone dusts, seed disinfectants and fertilizers.

★

Produced from the mineral "Attapulgite," an aluminum magnesium silicate, noted for its consistent and compatible composition, large adsorptive capacity, free-flowing characteristics, and low bulk density. Specially processed to insure physical uniformity.

ATTAPULGUS CLAY COMPANY

210 West Washington Square, Philadelphia 5, Pa.

Cable Address: "ATTACLAYCO"

DILUEX

This inert and compatible diluent has been successfully used for years in insecticides, fungicides, and fertilizers. Improves the dusting and flow of dry mixtures, disperses rapidly in water without lumping, makes for wide coverage, and has excellent adhesive quality. Gives full support to toxic ingredients. Samples and data on request.

FLORIDIN COMPANY

DEPT. L, 220 LIBERTY ST. WARREN, PA.

CLAYS, BALL

A tough, strong and very plastic clay, though not necessarily white in color, as a matter of fact it usually runs gray, tan, bluish, etc.—the name "Ball Clay" is derived from the original clay pits in England, where this kind of clay was mined in the form of balls, each ball weighing approx. 13 lbs.

CLAYS, ENAMELERS'

Clays which are rather plastic and "fatty"—must be capable of floating the non-plastic enamel ingredients. This type of clay should be extremely pure and free from carbonates. There are several uses for this clay in enamels, one, for the ground coat, the other, the finishing coat. During the past few years a combination of domestic clays, including a very pure Florida clay has become very popular with the enameling industry.

CLAYS, POTTERY-MAKERS'

Clay used by manufacturers of pottery—can be either the China Clay type or the Ball Clay type inasmuch as both types are used extensively by the pottery manufacturers. However, the term pottery clay usually applies to the plastic ball clay type.

Chrystal, Charles B, Co, Inc, 53 Park Pl, N Y — Barclay 7-2151

Dixie Clay Co, N Y
†Edgar Bros Co, Metuchen, N J
†Kentucky Clay Mining Co, Mayfield, Ky

CLAYS, PULVERIZED-AIRFLOATED

The term given to clays (regardless of what type) which have been properly dried (to approx. 2%) then put through an Airfloating Mill. The term "Airfloated" usually applies to the milled clay which, after being extremely finely pulverized is blown by a blast of air upward to the hopper—hence the term "Airfloated" because it is "floated" in the air.

†Amer Colloid Co, Merchandise Mart Plaza, Chicago, Ill — Superior 7-5637

CLAYS, RUBBER-MAKERS'

Generally a white grit free domestic china clay, having some very definite functions when introduced in a rubber compound to perform—a good Rubber Clay should lend a certain stiffening to the finished product—it should have the ability to mix with the crude rubber very readily, and when used should become absolutely "part" of the compound itself. All china clays are NOT necessarily good rubber clays, and about the only true method of determining one clay from another is by actual test, because the majority of china clays are not suitable for rubber due to the fact that they make for soft "flabby" products, rather than stiff, compact products.

CLAYS, SAGGER

This type of clay is usually made up of two or more tough plastic clays, one of the clays being rather strong tight burning and of the Ball Clay type, while the other should be rather open burning and refractory. The use of a Sagger Clay is for the making of receptacles in which ceramic products are placed when they are being fired or "cooked"—a Sagger in the pottery occupies the same position as a cooking-pot does in the kitchen.

Dixie Clay Co, N Y
†Kentucky Clay Mining Co, Mayfield, Ky

CLAYS, TEXTILE

An unusually smooth grit free white domestic or imported china clay—having certain suspending properties. However, the most important factor is the amount of silica and grit contained—this is because the clay is used in the manufacture of certain types of cotton cloth and also as an ingredient in delusterizing baths for the rayon goods.

COBALT (Metal)

Co. Steel-gray, malleable, magnetic metal. Sp. gr. 8.5-8.9. M.P. 1480°C. Sol. acids. Uses—mfr. cobalt salts, inks, paint and artists colors, filaments for electric lamps, liquid driers; catalyst in hardening oils; chemical catalyst and oxidizing agent; alloys in alloy steels; various metallurgical purposes; boiling linseed oil; coloring potteries, porcelains and glass; electroplating. Grades—tech. containing more or less nickel and iron; pure cobalt "shot" (granules about 98% Co).

†Baker, J T, Chem Co, Phillipsburg, N J — Phillipsburg, 5-2151

COLLODION (Pyroxylin)

Solution of tetranitrocellulose in ether, alcohol or other solvent. Pale yellow liq. Uses—mfr. photographic films, artificial pearls, patent leather, artificial leather, adhesives, toy balloons; vehicle for pharmaceuticals, corn removers, process engraving, printing reproductions; in medicine. Grades—U.S.P 1890; U.S.P. flexible; U.S.P. cantharidal; tech.

COLOR LAKES

A special type of pigment consisting essentially of an organic soluble coloring matter combined more or less definitely with an inorganic base or carrier and characterized by a bright color. There are three classes of color lakes: 1. The older original type composed of hydrate of aluminum dyed with a solution of the natural organic color; 2. The newer and far more extensively used type made by precipitating from solution various coal-tar colors by means of a metallic salt, tannin, or other suitable reagent, upon a base or carrier either previously prepared or coincidently formed; 3. A number of lakes combining both types in varying degree.

COLORS, EARTH

Natural pigments suitable for grinding in oils for paint manufacture—iron oxide is found widely distributed, usually in combination with alumina, silica, calcium, magnesium, manganese, and water. These ores usually have a brown, reddish brown, red, yellow, or black hue. The brightest natural red iron hematite is found near the southern shores of the Caspian Sea and the refined pigment made from this ore is known as Persian Gulf Oxide. Deposits of iron manganese ores, having a rich brownish green hue, were discovered on the Island of Cypress and the refined product is marketed under the name of Turkey Umbers. Siennas are named after the Italian town of Sienna near where large quantities of bright yellow iron oxide are found. The finished products are marketed as raw and burnt grades. Veins of hydrated iron oxides are the raw material for ochres. Others in the group are the metallic browns and the iron magnetites (black oxides of iron). Iron oxide colors are also the siennas or umbers, either raw or burnt. Precipitated yellow oxides compete intensely with French, Indian, and African ochres. Calcined and precipitated iron oxides compete with the natural red hematites, such as Persian Gulf and Spanish oxides. Earth colors are employed in paints, leather finishes, in latex rubber, etc. See Siennas, Ochres, Umbers, Iron Oxide, Red; Iron Oxide, Yellow.

COLORS, MORTAR, STUCCO

Variety of iron oxide, carbon black, lamp black, colors, ochres, siennas, mineral whites, umbers, etc., used to give wide tinctorial opportunity in the use of mortar, cement and stucco. Colors must have high alkali-acid resistance; must withstand the action of the elements over a long period of time.

COLORS PAPER-MAKERS'

When maximum whiteness has been obtained by bleaching pulp, paper manufacturers use blueing, such as ultramarine, and dyes, usually coal-tar anilines to tone the stock and offset any yellowness still remaining. These dyes, together with mineral pigments are employed to color the stock. The dyes penetrate the actual substance of the fibres. Pigments, however, color the stock by mechanical enmeshment with the fibres. See also, Dyes, Paper; Pigments, Paper. Pig-

COLORS PLASTIC

Special pigments, earth colors or soluble dyes, usually added during either the mixing or the rolling operation, which resist heat, pressure, etc.; possess ability to dissolve in certain common solvents, and impart generally that transparency of color so desirable in plastics. Among the pigments are:—Prussian blue, zinc oxide, titanium oxide, carbon black, lampblack, cadmium and chromium colors; the earth colors, such as siennas, ochres, and umbers; the synthetic dyes, such as triphenylmethane basic colors, many of the azo colors, certain of vat dyes, etc.

COPPER AMMONIUM SULFATE (Cupric Ammonium Sulfate, Copper Aminosulfate, Ammonio Cupric Sulfate)

$CuSO_4.4NH_3.H_2O$. Dark blue crystalline powd. Decomposes on heating. Sol. water. Uses—mfr. copper arsenate, insecticidal preparations; mordant in dyeing and printing textiles. Grades—tech.; C.P.

†Baker, J T, Chem Co, Phillipsburg, N J — Phillipsburg, 5-2151
Barclay Chem Co, Inc, 75 Varick St, N Y — Worth 4-5120

COPPER ARSENITE (Scheele's Green, Cupric Arsenic, Copper Orthoarsenite, Mineral Green, Swedish Green)

$CuHAsO_3$. M.W. 187.51. Light green, amorp. powd. Decomposes on heating. Sol. acids, alcohol; insol. water. Uses—pigment paint, varnish and wall paper; printing calico; insecticidal compositions; in medicine. Grades—tech.; C.P.

Barclay Chem Co, Inc, 75 Varick St, N Y — Worth 4-5120
†Mallinckrodt Chem Wks, 2 & Mallinckrodt Sts, St Louis, Mo — Central 8980

COPPER BROMIDE

$CuBr_2$. Black, deliq. cryst. or crystalline powd. Sol. alcohol, water, acetone. Uses—intensifier in photography; to replace iodine by bromine in organic synthesis.

†Baker, J T, Chem Co, Phillipsburg, N J — Phillipsburg, 5-2151
Denver Fire Clay Co, 2301 Blake St, Denver, Colo — Tabor 0251
†Mallinckrodt Chem Wks, 2 & Mallinckrodt Sts, St Louis, Mo — Central 8980

COPPER CARBONATE (Cupric Carbonate, Copper Subcarbonate, Brunswick Green, Bremen Green, Mineral Green, Artificial Malachite, Copper Lasur, Mountain Green)

$Cu_2(OH)_2CO_3$. Dark green powd. Sp. gr. 3.7-4.0. Decomposes on heating. Sol. acids; insol. water. Uses—mfr. copper salts, pyrotechnics; electroplating brass on copper; paint and varnish pigment; insecticide and germicide; coloring metals; astringent in pomades; antidote for phosphorous poisoning. Grades—tech. (50-52% copper, agricultural grade, 18-20%); C.P.

COPPER NITRATE (Cupric Nitrate)

a. $Cu(NO_3)_2.3H_2O$. b. $Cu(NO_3)_2.6H_2O$. Blue, deliq. cryst. Sp. gr. (trihydrate 2.047; (hexahydrate) 2.074. M.P. (trihydrate) 114.5°C.; (hexahydrate) 26.4°C. Sol. water, alcohol. Uses—mfr. photographic paper, enamels, paints, varnishes, dyestuffs, insecticidal compositions; in electroplating nickel; coloring copper black; as indigo reserve and mordant in dyeing and printing textiles; burnished effect on paints; in medicine. Grades—tech.; C.P.

COPPER OXALATE

$(COO)_2$ Cu. M.W. 151.69. Occurs as the semi-hydrate; bluish-white crystals. Insol. in water. Use—agricultural insecticide.

†Baker, J T, Chem Co, Phillipsburg, N J — Phillipsburg, 5-2151

COPPER OXIDE, BLACK (Cupric Oxide, Copper Monoxide)

CuO. M.W. 79.57. Brownish-black, amorp. powd. Sp. gr. 6.40. M.P. 1026°C. Sol. acids; insol. water. Uses—mfr. aromatic acids from cresols, paper, rayon, anti-fouling paints, ceramics, glazes and enamels, electric batteries, synth. precious stones; desulfurizing petroleum; electroplating metals; as germicide and insecticide; laboratory chemical; purification of hydrogen; as catalyst; green color in glass. Grades—tech.; C.P.

COPPER SULFATE (Blue Vitriol, Blue Stone, Blue Copperas, Roman Vitriol, Salzburg Vitriol)

$CuSO_4.5H_2O$. Blue, crystalline powd. or lumps. Efflorescent (when dehydrated almost white). Sp. gr. 2.284 (15°C.). Loses water at 110°C. Sol. water, alcohol. Uses—mfr. copper salts, printing inks, electric batteries, Paris green, Bordeaux mixture, casein glues; as mordant in printing and dyeing textiles; germicide, insecticide and fungicide; laboratory reagent; wood preservative; dehydrating agent (anhydrous form); pigments in paints and hair dyes; copper plating, etching, and in electrolytic baths; in the sweetening process in refining; for drawing wire; process engraving and photo engraving; tanning leather; purifying drinking water and swimming baths; preserving pulpwood and ground pulp; for coloring metals; in medicine. Grades—C.P.; tech.; 99% cryst.; granulated; powdered.
